7 Life-Span Development of the Brain and Behavior

The mature human brain has about 100 billion neurons The developing nervous system relies on genetic information and its environment

A zygote is a fertilized egg. A human embryo will develop three cell layers: Ectoderm-outer layer, becomes the nervous system The neural groove forms between ridges of the ectoderm

The neural tube forms from the neural ridges. The anterior part of the neural tube has three subdivisions-the forebrain, the midbrain, and the hindbrain. A developing human is called an embryo for the first 10 weeks, then is called a fetus.

1. Neurogenesis- mitosis produces neurons from nonneuronal cells 2. Cell migration-cells move to establish distinct populations 3. Differentiation-cells become distinctive neurons or glial cells Neurogenesis is the production of nerve cells. Nonneural cells divide through mitosis and form the ventricular zone. Cells leave the ventricular zone and become either neurons or glial cells.

During cell migration, cells move away from the ventricular layer. • Radial glial cells act as guides for cells to migrate along. • Cell adhesion molecules (CAMs) promote adhesion of parts of the nervous system to guide cells.

Psychology of Life Span Development - Psychology of Life Span Development by Dr. Bev Knox - Psychology Lectures 2,461 views 4 years ago 8 minutes, 29 seconds - Lecture Topic: Into to **Life Span Development**,. Life is a journey from womb to tomb. Developmental psychology is a branch of ...
