When tectonic plates collide, massive rocks underground deform and trigger a build-up of tempera-
ture and pressure.

When a volcano erupts, it throws out lava, together with gases, rocks and ashes.

Kinds or Stages of Volcano

During volcanic eruption, very hot lava flow can burn anything in its path.

The mudflow on lahar can cause landslides, flooding, and immense damage to buildings and Farms
Volcanic ash and dust released in the air can irritate the lungs and cause health problems.

Very strong eruptions can also trigger earthquakes.

The pyroclastic materials from a volcanic eruption can make the soil fertile.

The heat inside the volcano can cause gasses to come out through the holes or vents called
fumaroles. These fumaroles can provide geothermal steam to generate electricity.

Eruptions can also produce industrial materials like pumice and sulfur.

The rocks from volcanoes also help scientists study the interior of the Earth.
