The end of medicine as we know it - and why your health has a future

Medicine itself is sick. We hardly understand any disease and therefore need to chronically treat symptoms but not the causes. Consequently, drugs and other therapies help only very few patients; yet we are pumping more and more money into our healthcare system without any added value. Thus, the internationally renowned physician researcher, Harald Schmidt, predicts the end of medicine as we

know it. On a positive note, digitization will radically change healthcare and lead to one of the greatest socioeconomic revolutions of mankind. He is one of the pioneers of "systems medicine"

The World Drug Report 2005 provides one of the most comprehensive overviews of illicit drug trends at the international level. In addition, this year it presents the work of UNODC in two new areas of research: an estimate of the financial value of the world drug market, and the preliminary steps towards the creation of an illicit drug index. The analysis of trends, some going back 10 years or more, is presented in Volume 1. Detailed statistics are presented in Volume 2. Taken together these volumes provide the most up to date view of today's illicit drug situation.

Aging Men, Masculinities and Modern Medicine

Aging Men, Masculinities and Modern Medicine explores the multiple socio-historical contexts surrounding men's aging bodies in modern medicine from a global perspective. The first of its kind, it investigates the interrelated aspects of aging, masculinities and biomedicine, allowing for a timely reconsideration of the conceptualisation of aging men within the recent explosion of social science studies on men's health and biotechnologies including anti-aging perspectives. This book discusses both healthy and diseased states of aging men in medical practices, bringing together theoretical and empirical conceptualisations. Divided into four parts it covers: Historical epistemology of aging, bodies and masculinity and the way in which the social sciences have theorised the aging body and gender. Material practices and processes by which biotechnology, medical assemblages and men's aging bodies relate to concepts of health and illness. Aging experience and its impact upon male sexuality and identity. The importance of men's roles and identities in care-giving situations and medical practices. Highlighting how aging men's bodies serve as trajectories for understanding wider issues of masculinity, and the way in which men's social status and men's roles are made in medical cultures, this innovative volume offers a multidisciplinary dialogue between sociology of health and illness, anthropology of the body and gender studies.

Series editor Andrew Weil, MD, is Professor and Director of the Arizona Center for Integrative Medicine at the University of Arizona. Dr. Weil's program was the first such academic program in the U.S., and its stated goal is to combine the best ideas and practices of conventional and alternative medicine into cost effective treatments without embracing alternative practices uncritically.

The first edition of *Male Sexual Function: A Guide to Clinical Management* was published in 2001. Since that time, two new oral medications for erectile dysfunction (ED), Vardenafil (Levitra) and Tadalafil (Cialis), have been introduced. Links between ED and lower urinary tract symptoms have been postulated, advances in the basic science of erectile physiology have occurred, and the appreciation of ED as a form of endothelial dysfunction and a harbinger of other more potentially lethal forms of vascular disease has become more widespread. In some instances, third-party payers have reduced or eliminated coverage for ED treatments in an attempt to cut costs. They have classified sexual activity as "recreational," "lifestyle," or not medically necessary, but have failed to appreciate the negative consequences of ED, such as depression with all of its ramifications. *Male Sexual Function: A Guide to Clinical Management, Second Edition* is a comprehensive overview of the field of male sexual function and includes a chapter on female sexual dysfunction, an emerging field with a very high incidence in the population and an ever-growing following.

Cancer and Sexual Health

Rates of sexually transmitted infections (STIs) have significantly increased in the United States. Per-capita estimates reveal approximately 68 million prevalent and 26 million incident STIs nationally. Gonorrhea, syphilis, and chlamydia—the three reportable STIs—reached levels not seen in the last fifty years and this resurgence is concurrent with increasing antimicrobial resistance and a dearth of viable candidates in the vaccine pipeline. A seminal report by the National Academies of Sciences, Engineering, and Medicine, *Sexually Transmitted Infections: Adopting a Sexual Health Paradigm*, confirms that STIs rank among the most pressing and intractable public health threats. Furthermore, rising rates of STIs exact a substantial societal, medical, and economic burden that strain public health capacity, which has been substantially debilitated in the wake of the Covid-19 pandemic. STIs can have serious consequences for sexual, reproductive, and overall health. Untreated syphilis, for instance, is directly implicated in neurological, cardiovascular, and dermatological disease. Human papillomavirus is a known cause of cervical cancer and is the most common cancer among women globally. Hepatitis B increases risk for cirrhosis and primary liver cancer. Despite reductions in HIV transmission and improvements in prevention and treatment, infections among women, girls, adolescents, and mother-to-child transmission remain unacceptably high. Marginalized racial/ethnic minorities, LGBTQ persons, vulnerable at-risk adolescents and young adults, and other underrepresented populations are more susceptible to STIs as they negotiate an array of factors that can delay and even preclude access to preventive interventions. The United States spends substantially more on STI prevention and treatment yet it consistently bears a disproportionate burden of sexually transmitted infections compared to other Western industrialized nations. Access to healthcare, erosion and diversion of public health capacity, racism, discrimination, stigma, substandard education, and poverty have all been identified as important contributors to the trajectory of acute sexually transmitted infections. Furthermore, upstream drivers such as national, state, and local public health policies have been associated with population-level STI risk, prevention, and treatment and as such offer opportunities for ecological, observational, and multi-level analyses to assess their direct and indirect impact on sexual health outcomes. In this thematic collection, we aim to present an interdisciplinary collection of high-quality articles centered on the premise that the rise of emerging and re-emerging STIs can be attributed, in part, to a complex interaction of sociomedical factors beyond individual behavioral risk profiles. This Research Topic welcomes a variety of manuscript formats including original research, brief reports, systematic reviews, and perspective manuscripts involving sociomedical factors, social determinants of health, health disparities, infectious disease epidemiology, and other drivers including health policies that act as barriers and facilitators of effective STI prevention and treatment. Manuscripts that examine structural, community, institutional, interpersonal, and broad individual factors linked to STIs are very well suited for this collection. Topic areas include, but are not limited to:

- Structural racism, discrimination, and stigma and their influence on prevention, treatment, and support services among vulnerable and marginalized populations;
- Housing and income insecurity that impede sexual, reproductive, and overall health;
- Biological factors that affect the spread of STIs including their asymptomatic nature and the influence of sex as a biological variable;
- Intimate partner violence, harassment, and intimidation;
- Substance abuse, sex work, sexual networks, and normative sexual attitudes and beliefs that impede the adoption of preventive health-promoting behaviors;
- Priority populations including adolescents, men who have sex with men, youth who are LGBTQ, and the incarcerated;
- Impact of HIV pre-exposure prophylaxis (PrEP) uptake on STI incidence;
- Culturally-specific biopsychosocial, behavioral, and community-based STI interventions to treat and

support those afflicted with STIs; • Community mobilization and community-based organization to reduce STIs; • Community-level prevalence of infectious agents; • Local and holistically-integrated STI clinics; • Public health STI workforce capacity; • Health in All Policies (HiAP) approaches to STI prevention and treatment. Christopher Williams is the Senior Vice President and Director of Research at National Health Promotion Associates, a private research and development firm that specializes in the development, testing and dissemination of evidence-based approaches to target behavioral risk factors associated with major chronic diseases, violence, accidents and preventable injuries. The other Topic Editors declare no competing interests with regard to the Research Topic subject.

'McGregor is kickass; a respected crusader. If you're a woman, she's definitely the doctor you'd want to see in an emergency or to install as head of medical education' The Times A clarion call about the dangers of medicine for women, as well as a manual for how women can get the right care for their bodies. *Sex Matters* tackles one of the most urgent, yet unspoken issues facing women's health care today: all models of medical research and practice are based on male-centric models that ignore the unique biological and emotional differences between men and women - an omission that endangers women's lives. The facts surrounding how male-centric medicine impacts women's health every day are chilling: in the ER, women are more likely to receive a psychiatric diagnosis with regard to opioid use, while men are more likely to be referred for detoxification; the more vocal women become about their pain, the more likely their providers are to prescribe either inadequate or inappropriate pain relief medication; women often present with nontraditional symptoms of stroke, which causes delays in recognition by both them and their health professionals; and a government accountability study found that 80% of drugs that are withdrawn from the market are due to side effects that happen to women (a result of testing drugs mostly on men). Leading expert on sex and gender medicine Dr Alyson McGregor focuses on the key areas where these differences are most potentially harmful, addressing:

- Cardiac and stroke diagnosis and treatment in women;
- Prescription and dosing of pharmaceuticals;
- Subjective evaluation of women's symptoms;
- Pain and pain management;
- Hormones and female biochemistry (including prescribed hormones);
- How economic status, race, and gender identity are additional critical factors.

Not only does Dr McGregor explore these disparities in depth, she shares clear, practical suggestions for what we can do. A work of riveting expose, revelatory insights into the medical establishment and actionable guidance for putting this information to use, *Sex Matters* is an empowering roadmap for reinventing modern medicine - and for self-care.

Male Reproductive Dysfunction

In the United States, some populations suffer from far greater disparities in health than others. Those disparities are caused not only by fundamental differences in health status across segments of the population, but also because of inequities in factors that impact health status, so-called determinants of health. Only part of an individual's health status depends on his or her behavior and choice; community-wide problems like poverty, unemployment, poor education, inadequate housing, poor public transportation, interpersonal violence, and decaying neighborhoods also contribute to health inequities, as well as the historic and ongoing interplay of structures, policies, and norms that shape lives. When these factors are not optimal in a community, it does not mean they are intractable: such inequities can be mitigated by social policies that can shape health in powerful ways. *Communities in Action: Pathways to Health Equity* seeks to delineate the causes of and the solutions to health inequities in the United States. This report focuses on what communities can do to promote health equity, what actions are needed by the many and varied stakeholders that are part of communities or support them, as well as the root causes and structural barriers that need to be overcome.

ADAMHA News on Alcohol, Drug Abuse, and Mental Health

Dedicated to Martin Fishbein, the premier social psychologist in the area of attitude and attitude change, this volume focuses on his work as the codeveloper of reasoned action theory—an approach to behavioral prediction and change that has been used in thousands of research studies. Immediately after Fishbein's death, the Annenberg Public Policy Center at the University of Pennsylvania established a memorial lecture series in his honor. This volume offers ten formal papers derived from those lectures, starting with a summary of the evolution of reasoned action theory and a quantitative analysis of the current approach, followed by a discussion of ways to expand the capacity of the theory, and concluding with current examples of state-of-the-art applications of reasoned action theory focusing on different types of behavioral interventions. These articles attest to the general applicability of the theory and the heterogeneous contexts in which the theory can be productively applied. Together, they compose the most up-to-date treatment of the quantitative analysis of reasoned action theory currently available, and they show that there is considerable justification for comparing the reasoned action approach to other well-known scientific theories. This volume will appeal to students of political sociology and public health; to a multidisciplinary scholarly audience in sociology, public affairs, and social work; and to public health practitioners and foundation grant specialists.

Pharmacology for Nursing Care

Parkinson's Disease and Nonmotor Dysfunction fills a major gap in the current rapidly growing body of knowledge concerning Parkinson's disease. Drs. Pfeiffer and Bodis-Wollner have correctly perceived that many nonmotor features of Parkinson's disease are given insufficient attention in the medical literature. Unfortunately, they are often also given insufficient attention by the practicing neurologists who see these patients. As recently pointed out, there is clearly much more to Parkinson's disease than depletion of the nigrostriatal dopamine system (1). Parkinson's disease (not just multiple system atrophy) is a multisystem disorder, both pathologically and in its clinical manifestations. This is clearly true for the various motor system abnormalities, which are not fully corrected by dopamine replacement therapy strategies, but also for the nonmotor system abnormalities that are the subject of this volume. Although recently there has been increased awareness of the cognitive, psychiatric, and sleep disorders commonly associated with Parkinson's disease, many of their manifestations remain under-recognized and their importance in managing patients is underestimated. Even less attention is paid to the myriad of other nonmotor disturbances that plague these patients. For example, among the autonomic disorders, although orthostatic hypotension is well recognized, it is usually attributed to dopaminergic medications rather than to effects of the underlying disease. Urologic disorders are also very familiar in these patients, but may not be properly understood or well managed.

Taber's Cyclopedic Medical Dictionary

Over the last two decades, the implosion of economies under the burden of debt, the negative repercussions of structural adjustment programs, the crisis of legitimacy, civil wars, and the collapse of some states have resulted in serious health issues across the African continent. Newly emerging diseases, such as Ebola virus and HIV/AIDS have killed and disabled millions. Some “old diseases,” such as yellow fever, tuberculosis, and polio have reappeared. Malaria, cholera, and meningitis continue to kill thousands. In many countries, the medical infrastructure has collapsed, while an increasing number of physicians and nurses have migrated to more hospitable places. Stigmatization of the affected people has exacerbated social and racial discrimination and has affected the implementation of national and international public health programs. The complexity of the situation requires an interdisciplinary approach. This collection, including contributions by historians, sociologists, anthropologists, and biologists, emphasizes the social and cultural contexts of African health, paying particular attention to the history of the colonial public health system and its legacy.
