The Current and Future Outlook of Aquaculture and Aquaculture Nutrition 1 - The Current and Future Outlook of Aquaculture and Aquaculture Nutrition 1 by Jefe Nutrition 1,907 views 3 years ago 1 hour, 20 minutes - Albert Tacon gives a presentation on the current and the future outlook of **Aquaculture**, and **Aquaculture**, Nutrition.

Need to produce feeds for over 244 fish & crustacean species, for which Information on dietary nutrient requirements from fry to market size is lacking or poorly understood, with consequent greater reliance upon the use of fish meal/fish oil and live/fresh feed items

Some major issues & challenges facing the aquafeed sector 2. Current reliance of most countries upon the use of imported feed ingredient sources (ca. 50-80% of most aquafeeds in Asian countries are composed of imported feed ingredients), and trend of increasing feed ingredient

Increasing global concern for the environment & sustainability issues, and the fact that most farms are operated within public water bodies & as such have to be operated in a responsible manner (following the FAO CCRF) with little or no negative environmental or ecosystem impacts, including need for more sustainable ingredient sourcing, more digestible feeds etc

Need for aquafeed producers to allocate more resources & effort into developing their own in-house R&D facilities for feed testing and development, and by so doing ensuring the cost-effectiveness of their feeds; this is common for most feed manufacturers in Europe

Need to develop innovative processing & formulation techniques for the increased use of local feed resources, including use of enzyme/acid stabilization techniques for the production of hydrolysates/silages, use of fermentation technology for removal of ANF in plant proteins & production of SCP & use of dietary enzymes

Recognition of the important role played by farmed fish & seafood in human nutrition & health, global food security, and need for safe & wholesome aquatic foods

Realization that the nutritional profile of the cultured fish or shrimp can be manipulated & tailored to meet the needs of the consumer through the use of supplemental omega-3 fatty acids level (EPA/DHA), trace minerals (iron, zinc, selenium, iodine, chromium), vitamins (A, D, E) and/or fillet protein/lipid/calorific energy content

EDIBLE AQUATIC PLANTS OR SEA VEGETABLES Edible seaweeds contain considerable amounts of protein, with red seaweeds (*Porphyra* spp. or Nori) having highest levels (up to 47% dry wt); Lipids are rich in omega-3 polyunsaturated fatty acids, including EPA and to a lesser extent DHA; Rich source of minerals, including iodine; Rich source of vitamins, including vitamin C, niacin, folic acid, vitamin E, vit B2, B
