Exhaust gas, recirculation - EGR for short - is an ...

Then the EGR valve regulates the subsequent mixing of the exhaust gas with the intake air.

In petrol engines, this can also reduce carbon dioxide emissions and fuel consumption.

A key component of exhaust gas recirculation is the EGR valve.

Regulating throttles are used in the intake air system in diesel vehicles.

... **diesel engines**, to regulate the **exhaust gas**, recirculation ...

Cooled exhaust gas reduces the peak combustion temperature even further.

They must, therefore, be manufactured from highly corrosion and temperature-resistant materials.

Many of today's EGR coolers feature an electrical or pneumatic bypass flap.

Bypassing is also possible if high exhaust gas temperatures are required

An additional low-pressure EGR system is required.

With this system, the exhaust gas is taken after the particulate filter

An exhaust gas flap provides the exhaust gas back pressure required for this.

The first EGR Systems were used in some petrol-driven vehicles as early as the 70s.
