Hypothermia is a life threatening condition that may result in death.

The body's thermoregulation mechanism adjusts to weather changes.

The smooth muscle cells line the arteries and arterioles.

During cold, the signal from the brain causes vasoconstriction of the arterioles in the skin which allows the body to shift the blood to more vital areas of the body.

If the body is exposed to cold and the thermoregulation mechanism is unable to preserve the heat,

a drop in the core body temperature will occur.

As the body temperature drops, characteristic symptoms will occur such as shivering and mental confusion.

Hypothermia can be mild, moderate, severe or profound.

The body heat increases 2 - 4 times more with contraction of the muscles from exercises or by shivering.

Hypothermia may also be associated with frostbite.

SYMPTOMS OF HYPOTHERMIA - depends on the degree

Alcohol consumption increases the risk of developing hypothermia and does not help with the symptoms.

Elderly people are most prone to hypothermia.

Elderly people: . more fragile.

Children are also susceptible to hypothermia.

Paradoxical Undressing.

the heart rate may slow in patients with hypothermia.

Hyperthermia is different from hypothermia.

CONCLUSION Any drop in body temperature will make a person feel cold.
