"These notes are about the process of design: the process of inventing things which display new physical order, organization, form, in response to function." This book, opening with these words, presents an entirely new theory of the process of design. In the first part of the book, Christopher Alexander discusses the process by which a form is adapted to the context of human needs and demands that has called it into being. He shows that such an adaptive process will be successful only if it proceeds piecemeal instead of all at once. It is for this reason that forms from traditional un-self-conscious cultures, molded not by designers but by the slow pattern of changes within tradition, are so beautifully organized and adapted. When the designer, in our own self-conscious culture, is called on to create a form that is adapted to its context he is unsuccessful, because the preconceived categories out of which he builds his picture of the problem do not correspond to the inherent components of the problem, and therefore lead only to the arbitrariness, willfulness, and lack of understanding which plague the design of modern buildings and modern cities. In the second part, Mr. Alexander presents a method by which the designer may bring his full creative imagination into play, and yet avoid the traps of irrelevant preconception. He shows that, whenever a problem is stated, it is possible to ignore existing concepts and to create new concepts, out of the structure of the problem itself, which do correspond correctly to what he calls the subsystems of the adaptive process. By treating each of these subsystems as a separate subproblem, the designer can translate the new concepts into form. The form, because of the process, will be well-adapted to its context, non-arbitrary, and correct. The mathematics underlying this method, based mainly on set theory, is fully developed in a long appendix. Another appendix demonstrates the application of the method to the design of an Indian village.

Praise for Lean Accounting Best Practices for Sustainable Integration "Anyone involved in a lean transformation inevitably bumps up against the vagaries of the accounting systems that reward overproduction and waste and seem to punish true improvement. We wonder what would happen if the accountants actually came to the production floor and witnessed firsthand the havoc created by their systems. The Balanced Scorecard translates a company's vision and strategy into a coherent set of performance measures. The four perspectives of the scorecard--financial measures, customer knowledge, internal business processes, and learning and growth--offer a balance between short-term and long-term objectives, between outcomes desired and performance drivers of those outcomes, and between hard objective measures and softer, more subjective measures. In the first part, Kaplan and Norton provide the theoretical foundations for the Balanced Scorecard; in the second part, they describe the steps organizations must take to build their own Scorecards; and, finally, they discuss how the Balanced Scorecard can be used as a driver of change.

Nearly every country that produces cars views the automobile industry as strategically important because of its direct economic significance and because it serves as a bellwether for innovation in employment conditions. In this book, industrial relations experts from eleven countries consider the state of the industry worldwide. They are particularly interested in assessing whether the loudly heralded model of lean production initiated by Toyota has become pervasive. The contributors focus on employment practices: the way work is organized, how workers and managers interact, the way worker representatives respond to lean production strategies, and the nature of the adaptation and innovation process itself.

The World Health Organization's Global Technical Strategy for Malaria 2016- 2030 has been developed with the aim to help countries to reduce the human suffering caused by the world's deadliest mosquito-borne disease. Safety and Ethics in Healthcare: A Guide to Getting it Right

This book re-establishes the relevance of mainstream anthropological (and sociological) approaches to development processes and simultaneously recognizes that contemporary development ought to be anthropology's principal area of study. Professor de Sardan argues for a socio-anthropology of change and development that is a deeply empirical, multidimensional, diachronic study of social groups and their interactions. The Introduction provides a thought-provoking examination of the principal new approaches that have emerged in the discipline during the 1990s. Part I then makes clear the complexity of social change and development, and the ways in which socio-anthropology can measure up to the challenge of this complexity. Part II looks more closely at some of the leading variables involved in the development process, including relations of production; the logics of social action; the nature of knowledge; forms of mediation; and 'political' strategies.
