Drawing Conclusions: The Search for the Elusive Bottom Line

An experiment is internally valid when the effects on the dependent variable are due to the independent variable.

A manipulation check evaluates how well the experimenter manipulated the experimental situation. Subjects expect their data to be discarded if they guess the experimental hypothesis, and don't volunteer this information to the experimenter.

Debrief subjects after the experiment and convey that you want to know if they guessed the hypothesis.

Selecting the wrong statistical test Using a t-test to analyze ordinal data.

An experiment is externally valid when its findings can be extended to other situations and populations.

1. The experiment must be internally valid. 2. The experimental findings can be replicated.

The findings can be extended to a larger group than our sample.

The samples used in psychological research are often biased and may not represent the larger population.

Experimental variables like anger may have multiple operational definitions.

It is dangerous to generalize from a single experiment's operational definition of anger.

A study achieves research significance when its findings clarify or extend knowledge gained from previous studies and raise implications for broader theoretical issues.

We should question novel findings when they contradict prior findings that have been successfully replicated.

We want to generalize beyond the laboratory to increase the external validity of our findings.

Since extraneous variables are uncontrolled in real world setting and operate in complex combinations, they can modify the influence of our individual variables.

The trade-off is between the laboratory's more precise control of extraneous variables and the field experiment's greater realism and external validity.

Hanson (1980) found that more laboratory than field studies reported a positive correlation between reported attitudes and behavior.

We can't confirm external validity until additional studies are completed in field settings.

Aggregation is the grouping together and averaging of data to increase external validity.

Meta-analysis uses statistical analysis to combine and quantify data from many comparable experiments to calculate an average effect size.

Aggregation establishes external validity by combining the results of experiments performed using different subjects, stimuli and/or situations, trials or occasions, and measures.

A multivariate design studies multiple DVs.

Multivariate designs allow us to study the effect of an independent variable on combinations of dependent variables.

We analyze multivariate experiments with a multivariate analysis of variance (MANOVA).

Accept the outcome, don't reframe your result as "almost significant."

4. inconsistent or flawed procedures 5. ceiling and floor effects 6. insufficient power

If previous studies supported the hypothesis and ours did not, look for differences in experimental design or sample.

A Color Test That Can Tell Your Mental Age - A Color Test That Can Tell Your Mental Age by BRIGHT SIDE 44,041,119 views 6 years ago 7 minutes, 37 seconds - A lot of the times your brain "feels" way younger or older than you are. That's called mental age. Do you wanna know yours?

Sam Harris: Meditation, Consciousness, God & Trump (4K) - Sam Harris: Meditation, Consciousness, God & Trump (4K) by Dr Brian Keating 16,221 views 2 days ago 3 hours, 11 minutes - Today's guest really needs no introduction...but here it is just in case you've been under a rock or not on social media, like him.

Intro

Judging a book by its cover

Woke politics and recent developments in AI

Making your mind into a friend

Meditation and the nature of self

The analogy of the optic blind spot to explain the concept of the absence of a self. He describes how, through a simple experiment, one can confirm the existence of the optic blind spot by moving a dot on a piece of paper in and out of sight. Harris draws a parallel between this experience and the search for the self, suggesting that both require a deliberate and precise way of looking. He emphasizes that the sense of self is the anchor for most psychological suffering and that letting go of this sense of self leads to profound relief. Harris also mentions the importance of meditation in gaining perspective on the inner dialogue that often causes suffering. Additionally, we touch on the heightened sensitivity to grayscale intensity in the region of the optic blind spot, intriguing as an astronomer.

Slipping into psychopathy

Who Sam relies on for external advice

On Trump's narcissism

Musk's ambition to colonize Mars

Sam Harris shifts the conversation from religion to space exploration and the human obsession with leaving a legacy. He expresses his skepticism about the coherence of the idea of colonizing Mars as a backup plan for humanity, given our evolutionary success on Earth and the uncertainty of our ability to build a perfect city on the red planet. Harris also shares his perspective on human happiness and being a good person, emphasizing the importance of turning one's attention away from oneself and focusing on helping others. He criticizes the narcissistic nature of the Mars fantasy and the desire

for a grand legacy, comparing it to vanity and other negative emotions. Harris also questions Elon Musk's belief in Stoicism, suggesting that Musk's Mars mission might not align with the stoic precept of accepting the inevitability of death.

Does Sam miss academia?

Research on the brain's response to beliefs, focusing on the distinction between belief, disbelief, uncertainty and disgust. Harris emphasizes that higher cognitive functions, including belief and judgment, are built on lower structures and processes that evolved for other purposes. He shares his personal preference for thinking, writing, and speaking about the mind rather than conducting neuroimaging experiments himself. Harris also expresses his dream of using advanced neuroimaging technology to verify the truthfulness of podcast guests' statements.

Free will, consciousness, and scientific experimentation

Can AI have free will?

Should we teach kids meditation or religion?

Barbaric beliefs in different religions

Intro

Personality Test

Evaluating the Humanistic Perspective . Concepts like self-actualization are vague Emphasis on self may promote self- indulgence and lack of concern for others

Personality types, assessed by measures like the Myers-Briggs Type Indicator, consist of a number of traits. For example, a feeling type personality is sympathetic, appreciative, and tactful.

Factor Analysis Cattell found that large groups of traits could be reduced down to 16 core personality traits based on statistical correlations.

Personality Dimensions Hans and Sybil Eysenck suggested that personality could be reduced down to two polar dimensions, extraversion-introversion and emotional stability-instability.

MMPI-2

The Big Five Factors Today's trait researchers believe that Eysencks' personality dimensions are too narrow and Cattell's 16PF too large. So, a middle range (five factors) of traits does a better job of assessment.

The three factors, behavior, cognition, and environment, are interlocking determinants of each other. Bandura called the process of interacting with our environment reciprocal determinism.

Built from research on learning and cognition Fails to consider unconscious motives and individual disposition

Positive Psychology & Humanistic Psychology Positive psychology, such as humanistic psychology, attempts to foster human fulfillment. Positive psychology, in addition, seeks positive subjective well-being, positive character, and positive social groups.
