Scientists carried out a number of experiments to find out how phototropism works.

The scientists then covered the tips of the shoots with foil to block out the light.

The shoots did not grow towards the light ...

The scientists then used foil to cover the lower parts of the shoots.

This tells us that the lower parts of shoots are not sensitive to light.

We are going to look now at how shoots use the hormone auxin to grow towards the light.

Auxin is produced at the very tip of the shoot.
