Intro

A patient with S.T. segment elevation Myocardial Infarction has ongoing chest discomfort. Fibrinolytic therapy has been ordered. Heparin 4000 units I.V. bolus was administered, and a heparin infusion of 1000 units per hour is being administered. Aspirin was not taken by the patient because he had a history of gastritis treated 5 years ago. Your next action is to

A patient has sinus bradycardia with a heart rate of 36 beats per minute. Atropine has been administered to a total of 3 milligrams. A transcutaneous pacemaker has failed to capture. The patient is confused, and her systolic blood pressure is 110. Which of the following is now indicated?

A 62-year-old man suddenly experienced difficulty speaking and left-side weakness. He was brought to the emergency department. He meets initial criteria for fibrinolytic therapy, and a C.T. scan of the brain is ordered. What are the guidelines for antiplatelet and fibrinolytic therapy?

A patient with a possible S.T. segment elevation Myocardial Infarction has ongoing chest discomfort. Which of the following would be a contraindication to the administration of nitrates?

A patient is in cardiac arrest. Ventricular fibrillation has been refractory to a second shock. Of the following, which drug and dose should be administered first?

A 35-year-old woman has palpitations, light-headedness, and a stable tachycardia. The monitor shows a regular narrow- complex tachycardia at a rate of 180 per minute. Vagal maneuvers have not been effective in terminating the rhythm. An I.V. has been established. What drug should be administered?

A patient with sinus bradycardia and heart rate of 42 has diaphoresis and a systolic blood pressure of 80. What is the initial dose of atropine based on the current A.C.L.S. guidelines?

A patient is in refractory ventricular fibrillation and has received multiple appropriate defibrillation shocks, epinephrine 1 milligram I.V. twice, and an initial dose of 300 milligram amiodarone L.V. The patient is intubated. A second dose of amiodarone is now called for. The recommended second dose

A patient with a possible acute coronary syndrome has ongoing chest discomfort unresponsive to 3 sublingual nitroglycerin tablets. There are no contraindications, and 4 milligrams of morphine sulfate was administered. Shortly afterward, the systolic blood pressure falls to 88, and the patient has increased chest discomfort. You should

A patient has a rapid irregular wide-complex tachycardia. The ventricular rate is 138 per minute. The patient is asymptomatic with a systolic blood pressure of 110. He has a history of angina. Which of the following actions is recommended?

You arrive on the scene with the code team. High- quality C.P.R. is in progress. An A.E.D. has previously advised "no shock indicated." A rhythm check now finds asystole. After resuming high-quality compressions, your next action is to

A patient is in pulseless ventricular tachycardia. Two shocks and 1 dose of epinephrine have been given. Which is the next drug/dose to anticipate

Your patient has been intubated. Intravenous access has been unsuccessfully attempted twice. Which of the following is also an acceptable route for drug administration during a code?

A patient is in cardiac arrest. Ventricular fibrillation has been refractory to an initial shock. What is the recommended route for drug administration during CPR?

A patient is in refractory ventricular fibrillation. High-quality CPR is in progress, and shocks have been given. One dose of epinephrine was given after the second shock. An antiarrhythmic drug was given immediately after the third shock. What drug should the team leader request to be prepared for administration next?

A 57-year-old woman has palpitations, chest discomfort, and tachycardia. The monitor shows a regular wide-complex tachycardia at a rate of 180 beats per minute. She becomes diaphoretic, and her blood pressure is 80 over 60. The next action is to

A patient is in cardiac arrest. High-quality chest compressions are being given. The patient is intubated and an I.V. has been started. The rhythm is asystole. Which is the first drug/dose to

administer?

A 45-year-old woman with a history of palpitations develops light-headedness and palpitations. She has received adenosine 6 milligrams for the rhythm shown above without conversion of the rhythm. She is now extremely apprehensive. Her Blood pressure is 108 over 70. What is the next appropriate intervention?

#22: A patient in the emergency department develops recurrent chest discomfort suspicious for ischemia. Oxygen is being administered via a nasal device at 4 Liters per minute, and an I.V. line is in place. The systolic blood pressure is 160. There are no allergies or contraindications to any medication. You would first order

Following initiation of CPR and 1 shock, Ventricular fibrillation persists. A second shock is given and chest compressions are resumed immediately. An I.V. is in place and no drugs have been given. Bag-mask ventilations are producing visible chest rise. What is your next order?

You arrive on the scene to find a 56-year-old diabetic woman with dizziness. She is pale and diaphoretic. Her systolic blood pressure is 80. The cardiac monitor shows a brady arrhythmia. The Client is receiving oxygen at 4 Liters per minute and an I.V. has been established. Your next order is I Attempted Victoria Beckham's Diet (DANGEROUS & BASICALLY IMPOSSIBLE) - I Attempted Victoria Beckham's Diet (DANGEROUS & BASICALLY IMPOSSIBLE) by Abbey Sharp 551,484 views 1 year ago 21 minutes - Hey everyone I'm Abbey Sharp welcome to Abbey's Kitchen.
