The Dynamics of Science and Technology

The interrelations of science and technology as an object of study seem to have drawn the attention of a number of disciplines: the history of both science and technology, sociology, economics and economic history, and even the philosophy of science. The question that comes to mind is whether the phenomenon itself is new or if advances in the disciplines involved account for this novel interest, or, in fact, if both are interconnected. When the editors set out to plan this volume, their more or less explicit conviction was that the relationship of science and technology did reveal a new configuration and that the disciplines concerned with its analysis failed at least in part to deal with the change because of conceptual and methodological preconceptions. To say this does not imply a verdict on the insufficiency of one and the superiority of any other disciplinary approach. Rather, the situation is much more complex. In economics, for example, the interest in the relationship between science and technology is deeply influenced by the theoretical problem of accounting for the factors of economic growth. The primary concern is with technology and the problem is whether the market induces technological advances or whether they induce new demands that explain the subsequent diffusion of new technologies. Science is generally considered to be an exogenous factor not directly subject to market forces and, therefore, appears to be of no interest.

The Dynamics of Science and Technology

The interrelations of science and technology as an object of study seem to have drawn the attention of a number of disciplines: the history of both science and technology, sociology, economics and economic history, and even the philosophy of science. The question that comes to mind is whether the phenomenon itself is new or if advances in the disciplines involved account for this novel interest, or, in fact, if both are interconnected. When the editors set out to plan this volume, their more or less explicit conviction was that the relationship of science and technology did reveal a new configuration and that the disciplines concerned with *1tS* analysis failed at least in part to deal with the change because of conceptual and methodological preconceptions. To say this does not imply a verdict on the insufficiency of one and the superiority of any other one disciplinary approach. Rather, the situation is much more complex. In economics, for example, the interest in the relationship between science and technology is deeply influenced by the theoretical problem of accounting for the factors of economic growth. The primary concern is with technology and the problem is whether the market induces technological advances or whether they induce new demands that explain the subsequent diffusion of new technologies. Science is generally considered to be an exogenous factor not directly subject to market forces and, therefore, appears to be of no interest.

Resources in Education

This book presents the scientific output of the TUFF research school in Sweden. In this school, a group of active teachers worked together on a series of educational research studies. All of those studies were related to the teaching about technology and engineering. The research program consisted of studies at various angles of view: a philosophical view, a national view, and a classroom practice view. The book is a showcase of how a well-conducted research program for teachers can lead to good contributions to technology education research. A selection of topics: the nature of technological knowledge, mental images of engineers and engineering, the process of choosing for a study in technology, teachers' beliefs about technology education and assessment. These topics are directly related to major issues in the international technology education research agenda. The studies presented here were the basis of the authors' Ph.D. theses. The teachers' chapters are preceded by a description of ideas behind the TUFF research school and the way it was realized.

Technology Teachers as Researchers

This volume brings together contributions that resemble spotlights thrown on the past twenty-five years of science and technology studies. It covers a broad range: history of science; science and politics; science and contemporary democracy; science and the public; science and the constitution; science and metaphors; and science and modernity and provides a critical overview of how the field of science and technology studies has emerged and developed.

Social Studies of Science and Technology: Looking Back, Ahead

First multi-year cumulation covers six years: 1965-70.

Current Catalog

This is the first systematic examination of the contemporary and prior connections between technological progress and pessimism over the future. If the hallmark of the Enlightenment was a firm belief in technology as a principal instrument of universal progress, the hallmark of postmodernism may well be skepticism, even despair, over technology's role in shaping our world. This book incorporates the perspectives of historians, political scientists, philosophers, and literary scholars to illuminate the origins, evolution, and influence of technological pessimism and to evaluate its long-term prospects. The volume should appeal to specialists in technology studies and the history of ideas but also to general readers concerned with these dilemmas of technological progress.

Technology, Pessimism, and Postmodernism

This volume offers one of the first systematic analyses of the rise of modern social science. Contrary to the standard accounts of various social science disciplines, the essays in this volume demonstrate that modern social science actually emerged during the critical period between 1750 and 1850. It is shown that the social sciences were a crucial element in the conceptual and epistemic revolution, which paralleled and partly underpinned the political and economic transformations of the modern world. From a consistently comparative perspective, a group of internationally leading scholars takes

up fundamental issues such as the role of the Enlightenment and the French Revolution in the shaping of the social sciences, the changing relationships between political theory and moral discourse, the profound transformation of philosophy, and the constitution of political economy and statistics.

The Rise of the Social Sciences and the Formation of Modernity

The establishment of national systems of retrospective research evaluations is one of the most significant of recent changes in the governance of science. This volume discusses the birth and development of research evaluation systems as well as the reasons for their absence in the United States. The book combines the latest research and an overview of trends in the changing governance of research. The focus is on institutionalisation processes and impacts on knowledge production.

The Changing Governance of the Sciences

Engineering the Revolution documents the forging of a new relationship between technology and politics in Revolutionary France, and the inauguration of a distinctively modern form of the “technological life.” Here, Ken Alder rewrites the history of the eighteenth century as the total history of one particular artifact—the gun—by offering a novel and historical account of how material artifacts emerge as the outcome of political struggle. By expanding the “political” to include conflict over material objects, this volume rethinks the nature of engineering rationality, the origins of mass production, the rise of meritocracy, and our interpretation of the Enlightenment and the French Revolution.

Engineering the Revolution

‘Scientific advice to politics’, the ‘nature of expertise’, and the ‘relation between experts, policy makers, and the public’ are variations of a topic that currently attracts the attention of social scientists, philosophers of science as well as practitioners in the public sphere and the media. This renewed interest in a persistent theme is initiated by the call for a democratization of expertise that has become the order of the day in the legitimation of research funding. The new significance of ‘participation’ and ‘accountability’ has motivated scholars to take a new look at the science – politics interface and to probe questions such as “What is new in the arrangement of scientific expertise and political decision-making?”

Democratization of Expertise?

Explores the origins of contemporary drug regulation and the modern clinical trial.

The Progress of Experiment

Present trends indicate that in the years to come transnational science, whether basic or applied and involving persons, equipment or funding, will grow considerably. The main purpose of this volume is to try to understand the reasons for this denationalization of science, its historical contexts and its social forms. The Introduction to the volume sets out the socio-political, intellectual, and economic contexts for the nationalization and denationalization of the sciences, processes that have extended over four centuries. The articles examine the specific conditions that have given rise to the growth of transnational science in the 20th century. Among these are: the need for cognitive and technical standardization of scientific knowledge-products, pressure toward cost-sharing of large installations such as CERN, the voluntary and involuntary migration of scientists, and the global market for R&D products that has emerged at the end of the century. The volume raises many new questions for research by historians and sociologists of science and poses problems that are of concern both to scientists and science policy-makers.

Denationalizing Science

ICT-Driven Economic and Financial Development: Analyses of European Countries demonstrates the effects of ICT diffusion on economic, social and financial development by examining their impact on the structure and dynamics of national economies. It provides the insight into shifts observed in labour markets, international trade activities productivity factors, education and use of innovative financial products. It combines empirical analyses and data sources stretching back to 1990 make it an important contribution to understanding the effects of ICT diffusion on economic and financial development. The book answers questions such as how will national and regional economies react to upcoming ICT developments and growing usage, and what is the magnitude of impact of new information and communication technologies on various aspects of social and economic life. Demonstrates the process

fo ICT spread across European countries Analyzes the value of ICTs from both economic and social perspective Examines structural changes in financial markets caused by ICTs implementation

ICT-Driven Economic and Financial Development

The Handbook Philosophy of Technology and Engineering Sciences addresses numerous issues in the emerging field of the philosophy of those sciences that are involved in the technological process of designing, developing and making of new technical artifacts and systems. These issues include the nature of design, of technological knowledge, and of technical artifacts, as well as the toolbox of engineers. Most of these have thus far not been analyzed in general philosophy of science, which has traditionally but inadequately regarded technology as mere applied science and focused on physics, biology, mathematics and the social sciences. • First comprehensive philosophical handbook on technology and the engineering sciences • Unparalleled in scope including explorative articles • In depth discussion of technical artifacts and their ontology • Provides extensive analysis of the nature of engineering design • Focuses in detail on the role of models in technology

Philosophy of Technology and Engineering Sciences

When the socialist regime in Central and Eastern Europe (CEE) was overthrown around the end of the eighties, beginning of the nineties, an overall transformation of whole societies started. Not only the political and the economic systems of these countries, but all societal sectors underwent deep changes. These changes presented opportunities, but they also spelled trouble. On one hand, getting rid of stifling political control and excessive bureaucratic regulation was something which most members of these societies desired. On the other, it became apparent very soon that the necessary and long hoped-for rebuilding of the economy, education, health care, the mass media, and science, too, was strongly restricted by the scarcity of financial resources. After a short period, during which opportunities were energetically taken up in a spirit of hope, came a long and still lasting time of growing troubles and despondency. Only in a few of the CEE countries have some glimpses of hope become visible recently; and it remains to be seen whether these signals are reliable. Until now, therefore, the transformation dynamics of all societal sectors in all of the CEE countries have primarily been troublesome. This is surely true for the post-socialist research systems. The demise of the communist party's absolute rule over society has allowed researchers the public expression and the pursuit of goals whose common denominator has been a greater self-regulation of scientific research according to its own criteria and logic.

East European Academies in Transition

not lie in the conceptual distinctions but in the perceived functions of metaphors and whether in the concrete case they are judged positive or negative. The ongoing debates reflect these concerns quite clearly~ namely that metaphors are judged on the basis of supposed dangers they pose and opportunities they offer. These are the criteria of evaluation that are obviously dependent on the context in which the transfer of meaning occurs. Our fundamental concern is indeed the transfer itself~ its prospects and its limits. Looking at possible functions of metaphors is one approach to understanding and elucidating sentiments about them. The papers in this volume illustrate, by quite different examples, three basic functions of metaphors: illustrative, heuristic~ and constitutive. These functions represent different degrees of transfer of meaning. Metaphors are illustrative when they are used primarily as a literary device, to increase the power of conviction of an argument, for example. Although the difference between the illustrative and the heuristic function of metaphors is not great, it does exist: metaphors are used for heuristic purposes whenever "differences" of meaning are employed to open new perspectives and to gain new insights. In the case of "constitutive" metaphors they function to actually replace previous meanings by new ones. Sabine Maasen in her paper introduces the distinction between transfer and transformation.

The Quantifying Spirit in the Eighteenth Century

Best known as the leading historian of French railways, François Caron has also done significant work on topics as varied as electricity, water and steam power, the theory of innovation, the structure of enterprise, and other aspects of economic development in the nineteenth and twentieth centuries. In this volume, he brings together these different facets of his expertise in order to present a broad panorama of modern technology. Caron shows how artisanal know-how was adapted, expanded, and formalized during the three industrial revolutions that swept over Great Britain, France, Germany, and

the United States in a comprehensive analysis of this long, complex, and continuous historical process, leading up to the twenty-first century. Thus, he illustrates the increasingly fruitful interaction between technological and scientific knowledge in modern times.

Biology as Society, Society as Biology: Metaphors

Since the 1970s, various sociological approaches have tried to understand and conceptualize "the global," yet few of them have systematically addressed the full spectrum of social relationships. Prominent exponents of the global approach - such as world systems analysis - instead have focused on particular domains such as politics or the economy. Under the label of "world society," however, some authors have suggested alternatives to the predominant equivocation of society and the nation-state. The contributions to this volume share that objective and take their point of departure from the two most ambitious projects of a theory of world society: world polity research and systems theory, mapping out the common ground and assessing their potential to inform empirical analyses of globalization.

Dynamics of Innovation

Bringing together philosophy, literary criticism and textual theory, social and political theory, and the philosophy of language and cognitive science, this collection intends to establish an interpretive framework for exploring the ubiquity and mediacy of technology.

From Globalization to World Society

The past few decades have witnessed a dramatic expansion of management education, consulting, and the formalization of management practice, with a widespread diffusion of management ideas across sectors and continents. This book describes and analyzes this worldwide flow of management ideas and the key carriers of these ideas.

From Artifact to Habitat

A study of French military engineers at a crucial point in the evolution of modern engineering.

The Expansion of Management Knowledge

Anthropological approaches to the sciences have developed as part of a broader tradition concerned about the place of the sciences in today's world and in some basic sense concerned with questions about the legitimacy of the sciences. In the years since the second World War, we have seen the emergence of a number of different attempts both to analyze and to cope with the successes of the sciences, their broad penetration into social life, and the sense of problem and crisis that they have projected. Among the movements concerned about the earlier responses were the development of social responsibility of scientists and technological practitioners. There is little doubt that this was a direct outgrowth of the role of science in the war epitomized by the successful construction and catastrophic use of the atomic bomb. The recognition of the deep social utility of science, and especially its role as an instrument of war, fostered curiosity about the earlier development of scientific disciplines and institutional forms. The history of science as an explicit discipline with full-time practitioners can be seen as an attempt to locate science in temporal space - first in its intellectual form and secondly in its institutional or social form. The sociology of science, while certainly having roots in the pre-war work of Robert K.

Conserving the Enlightenment

This handbook presents the state of the art of quantitative methods and models to understand and assess the science and technology system. Focusing on various aspects of the development and application of indicators derived from data on scholarly publications, patents and electronic communications, the individual chapters, written by leading experts, discuss theoretical and methodological issues, illustrate applications, highlight their policy context and relevance, and point to future research directions. A substantial portion of the book is dedicated to detailed descriptions and analyses of data sources, presenting both traditional and advanced approaches. It addresses the main bibliographic metrics and indexes, such as the journal impact factor and the h-index, as well as altmetric and webometric indicators and science mapping techniques on different levels of aggregation and in the context of their value for the assessment of research performance as well as their impact on research policy and society. It also presents and critically discusses various national research evaluation systems.

Complementing the sections reflecting on the science system, the technology section includes multiple chapters that explain different aspects of patent statistics, patent classification and database search methods to retrieve patent-related information. In addition, it examines the relevance of trademarks and standards as additional technological indicators. The Springer Handbook of Science and Technology Indicators is an invaluable resource for practitioners, scientists and policy makers wanting a systematic and thorough analysis of the potential and limitations of the various approaches to assess research and research performance.

Sciences and Cultures

What has dictated the rate and direction of technological change? How central has it been to industrial progress? How has it related to other determinants of economic growth and development? In *Technology and Industrial Progress*, Dr von Tunzelmann examines theoretical views on the nature and contribution of technology, and the empirical evidence from the major industrializing countries from the 18th century to the present day. The experiences of countries regarded in their time as the leaders of industrialization - Britain in the 18th century, the United States in the 19th century and Japan in the 20th century - are critically compared by the author. The following chapters study the transfer of each of these patterns of technology and growth to later industrializers, such as continental Europe, the Soviet Union, and today's newly industrializing countries. Adopting approaches drawn from evolutionary economics, Dr von Tunzelmann links micro-level phenomena relating to individual firms and technologies to macro-level outcomes as reflected in economic growth and development. This long-awaited book is exceptional both in the range of countries surveyed and the breadth of topics analysed, encompassing changes in production processes, products and marketing, management and finance.

Springer Handbook of Science and Technology Indicators

In *The Shock of Recognition*, Lewis Pyenson examines art and science together to shed new light on common motifs in Picasso's and Einstein's education, in European material culture, and in the intellectual life of one nation-state, Argentina.

Technology and Industrial Progress

From 1868–1872, German geologist Ferdinand von Richthofen went on an expedition to China. His reports on what he found there would transform Western interest in China from the land of porcelain and tea to a repository of immense coal reserves. By the 1890s, European and American powers and the Qing state and local elites battled for control over the rights to these valuable mineral deposits. As coal went from a useful commodity to the essential fuel of industrialization, this vast natural resource would prove integral to the struggle for political control of China. Geology served both as the handmaiden to European imperialism and the rallying point of Chinese resistance to Western encroachment. In the late nineteenth century both foreign powers and the Chinese viewed control over mineral resources as the key to modernization and industrialization. When the first China Geological Survey began work in the 1910s, conceptions of natural resources had already shifted, and the Qing state expanded its control over mining rights, setting the precedent for the subsequent Republican and People's Republic of China regimes. In *Empires of Coal*, Shellen Xiao Wu argues that the changes specific to the late Qing were part of global trends in the nineteenth century, when the rise of science and industrialization destabilized global systems and caused widespread unrest and the toppling of ruling regimes around the world.

The Shock of Recognition

A comprehensive and fascinating account of electrical and electronics history. Much of the infrastructure of today's industrialized world arose in the period from the outbreak of World War I to the conclusion of World War II. It was during these years that the capabilities of traditional electrical engineering—generators, power transmission, motors, electric lighting and heating, home appliances, and so on—became ubiquitous. Even more importantly, it was during this time that a new type of electrical engineering—electronics—emerged. Because of its applications in communications (both wire-based and wireless), entertainment (notably radio, the phonograph, and sound movies), industry, science and medicine, and the military, the electronics industry became a major part of the economy. *Dawn of the Electronic Age* explores how this engineering knowledge and its main applications developed in various scientific, economic, and social contexts, and explains how each was profoundly

affected by electrical technologies. It takes an international perspective and a narrative approach, unfolding the story chronologically. Though a scholarly study (with sources of information given in endnotes for engineers and historians of science and technology), the book is intended for the general public. Ultimately, it tells the story of the development of a new realm of engineering and its widespread applications during the remarkable and tragic period of two world wars and the decades in between.

Empires of Coal

these. In this book, we appropriate their conception of research-technology, and extend it to many other phenomena which are less stable and less localized in time and space than the Zeeman/Cotton situation. In the following pages, we use the concept for instances where research activities are orientated primarily toward technologies which facilitate both the production of scientific knowledge and the production of other goods. In particular, we use the term for instances where instruments and methods traverse numerous geographic and institutional boundaries; that is, fields distinctly different and distant from the instruments' and methods' initial focus. We suggest that instruments such as the ultra-centrifuge, and the trajectories of the men who devise such artefacts, diverge in an interesting way from other forms of artefacts and careers in science, metrology and engineering with which students of science and technology are more familiar. The instrument systems developed by research-technologists strike us as especially general, open-ended, and flexible. When tailored effectively, research-technology instruments potentially fit into many niches and serve a host of unrelated applications. Their multi-functional character distinguishes them from many other devices which are designed to address specific, narrowly defined problems in a circumscribed arena in and outside of science. Research technology activities link universities, industry, public and private research or metrology establishments, instrument-making firms, consulting companies, the military, and metrological agencies. Research-technology practitioners do not follow the career path of the traditional academic or engineering professional.

Dawn of the Electronic Age

Workers' Participation in Post-Liberation France is a vivid portrait of French labor's failure to achieve greater industrial democracy. Drawing on original archival research, Adam Steinhouse recasts the traditional view of this critical period of French history, demonstrating the fundamental importance of the immediate post-liberation period in determining the future course of industrial relations in France. He brings to life the labor disputes of the 1940s, charting the interplay between industry and politicians that dealt a crushing blow to organized labor's demands for political change. Steinhouse captures the rise of state intervention in the economy and plots the growth of French employers' organized intransigence in the face of workers' collective action; which culminated in a series of actions effectively marginalizing labor's voice in the economic boom of the early 1950s. Steinhouse's impressive scholarship provides an excellent case study of the French state and its efforts to balance growing worker demands for representation with the imperatives of social peace and prosperity. This book makes a significant contribution to modern French political history and the development of modern industrial relations.

Instrumentation Between Science, State and Industry

How can we develop a scientific basis for architectural, urban and technical design? When can a design be labelled as scientific output, comparable with a scientific report? What are the similarities and dissimilarities between design and empirical research, and between design research, typological research, design study and study by design? Is there a need for a particular methodology for design driven study and research? With these questions in mind, more than forty members of the Faculty of Architecture of the Delft University of Technology have described their ways of study and research. Each chapter shows the objectives, the methodology and its implementation in search for a deeper knowledge of design processes and an optimal quality of the design itself. The authors - among them architects, urban planners, social scientists, lawyers, technicians and information scientists - have widely differing backgrounds. Nevertheless, they share a great deal. The central focus is a better understanding of design processes, design tools and the effects of design interventions on issues such as utility, aesthetics meaning, sustainability and feasibility.

Workers' Participation in Post-liberation France

This text is about some of the ways in which the police have made use of information technology (IT). The interest is in why some information systems succeed in contributing to performance and

gaining the acceptance of users, while other systems fail to do so. understand the social character of technical innovation. The context of policing is complex and can be analyzed at several different, thought intersecting levels - the external environment; the organization as a whole; departments, sections or interests within the organizations; and particular work groups and networks. When the police embark on major changes - including technical changes - they are caught up in a web of contradictions and conflicts in both their internal and external relations. IT has its uses but does not provide an instant fix for policing problems.

The Relationship of Science and Technology

"While many dictionaries of economics are available for purchase, this title is unique because of its greater depth of treatment. It offers histories and backgrounds on a significant number of economic topics, not only for the United States but also for other countries and geographic regions. Entries cover such topics as economic concepts; markets and industries; economic development in various countries; biographical essays on key people in economics and business; business products, including coffee, gas, and oil; and the economic aspects of historical events and time periods, including the Great Depression."--"The Top 20 Reference Titles of the Year," American Libraries, May 2004.

Ways to Study and Research Urban, Architectural and Technical Design

By the 1980s, UK government research laboratories were an often quirky but always essential part of the state sector. In one of the most radical experiments in the organization and management of scientific research attempted in the UK, successive Conservative governments sought to reform these laboratories by applying the market-based solution of 'New Public Management'. Scrutinising Science explores and critiques that reform process by examining the laboratories' new organizational forms, the new visions of what science is for implicit in the reform agenda and the new forms of scientific knowledge production that have arisen as a consequence.

Gravity Compilation: Crash Course Kids - Gravity Compilation: Crash Course Kids by Crash Course Kids 2,756,128 views 7 years ago 14 minutes, 33 seconds - Maybe you'd like to just hear about one topic for a while. We understand. So today, let's just watch some videos about Gravity.

Intro

WHY DID THE APPLE FALL DOWN TO THE GROUND, AND NOT UP, OR SIDEWAYS?

NO MATTER WHERE YOU THROW THE BALL, IT'S GOING DOWN.

DOES GRAVITY REALLY PULL DOWN?

GRAVITY PULLS THINGS DOWN TO EARTH

NO MATTER WHERE ON EARTH AN OBJECT IS, THE PLANET'S GRAVITATIONAL PULL WILL DRAW THE OBJECT TOWARD IT.

EPISODE 13.2 OVER (TO) THE MOON

THE GREATER AN OBJECT'S MASS IS, THE GREATER THE EFFECT OF ITS GRAVITY, OR PULL ON OTHER OBJECTS IS.

WHAT HAPPENS TO SOMETHING WHEN IT MOVES CLOSER TO AN OBJECT

SHOOTING STARS METEORS: OCCUR WHEN PIECES OF ROCK BREAK OFF FROM A PASSING COMET OR ASTEROID.

THE SIZE OF THE OBJECT

THE DISTANCE BETWEEN OBJECTS

ALL THINGS CAUGHT IN OUR PLANET'S GRAVITY WILL, IN SOME WAY, HAVE THE POTENTIAL TO FALL TO EARTH

THE GASES THAT MAKE UP EARTH'S ATMOSPHERE PUSH AGAINST OBJECTS AS THEY FALL.
