Combining SNIa, CMB, and baryon acoustic oscillations

Horizon problem: consider looking out at the last scattering surface.

Inflation during the very early universe, there was a temporary era when $a \propto t^0$.

Inflation, by increasing the particle horizon size, prevents the CMB from having large temperature fluctuations ($\Delta T/T \sim 10^{-5}$).

When dark matter decouples from other components of the universe ($t \sim 10^{-8}$ sec for WIMPs), it has low-amplitude density fluctuations

Prediction: inflationary density perturbations should have a power spectrum

The initial $P \propto k^{-0.97}$ spectrum is modified on small scales during the era of radiation domination.

During the matter-dominated era, density fluctuations in dark matter evolve by gravitational instability:

"The rich get richer, the poor get poorer."

Growth of density perturbations

Observational cosmology relies on empirical calibration tools and training sets to measure the properties of celestial objects.

Claims made by Subir Sarkar suggest a revision of the cosmological principle and challenge the consensus on dark energy.

Looking at distant objects confirms Einstein's theory of general relativity through observations of gravitational lensing.
