A Colour Atlas of Minor Operations on the Hand

The New Contract which came into force on April 1st 1990 includes proposals for the provision of minor surgery services by the General Practitioner. The aim of this book is to assist those doctors undertaking minor surgery in their Practices. It is intended to present a practical, clear and concise text. This is accompanied by easy to follow illustrations. The contents of the book are governed by two considerations. Firstly, it covers only those procedures which are safe for the patient. Secondly, it only includes minor surgery which it is possible for the ordinary General Practitioner in a busy practice to undertake. VII Chapter One The Advantages of Minor Surgery in General Practice Minor Surgery:- Despite this descriptive term, no surgery can be considered "minor" no matter where it is carried out! It requires a knowledge of anatomy and basic surgical principles. There must be an understanding of the procedures and technical skills required. Careful planning is needed at all stages. Arrangements must also be made to deal with any complications and disasters which may occur. Having stated these provisos, however, surgical procedures can and should be an important part of general practice within the British National Health Service (NHS). There are many advantages to be gained, both for patient and doctor, when minor surgery is undertaken by the general practitioner.

Colour Atlas of Minor Surgery in General Practice

Minor surgery is part of the everyday practice of many doctors, with procedures such as lancing of abscesses or skin-tag removal increasingly carried out in a community setting. This full-colour atlas presents the 30 or so most common minor surgical procedures undertaken by the general practitioner, junior hospital doctor or surgeon. An introductory section describes the basic principles and equipment

needed. For each procedure, brief text outlines the pathology, diagnosis, surgical principles and potential complications, accompanied by colour photographs illustrating the technique.

Aimed at oral and maxillofacial surgeons, prosthodontists and general dental practitioners, this book demonstrates how to complete various surgical procedures which can be performed either in the dentist's surgery or hospital, in the case of more complex techniques.

A Colour Atlas of Minor Surgery

This book is a highly illustrated reference book for the general dentist who wants to expand his office. Detailed line drawings are used to present oral and maxillofacial procedures step-by-step. This book is a resource for both clinical and patient management for outpatient minor oral surgery. Dentists can learn to perform oral and surgical techniques that they previously referred to oral surgeons.

A Colour Atlas of Parotidectomy

This surgical atlas, featuring a wealth of color photographs, provides detailed step-by-step descriptions of a wide range of open head and neck procedures, including radical and conservative (organ preservation, functional) approaches, aesthetic and reconstructive surgeries with the use of axial and free flaps, and surgery within the narrow confines of the skull base. Individual chapters are dedicated to surgery of the nose and paranasal sinuses, larynx and trachea, thyroid, salivary glands, mandible, face and lips, and neck, the repair of external nose defects, the use of axial and free flaps, and surgical treatment of temporal bone malignancy. The atlas will be a comprehensive practical reference for clinicians in the various specialties involved in head and neck surgery, including otolaryngologists, head and neck surgeons, plastic surgeons, maxillofacial surgeons and surgical oncologists. It will assist practitioners in achieving the high level of competence that is essential owing to the large number of vital structures in the head and neck region.

A radial forearm free flap is one way of filling a hole which is left when a cancer has been removed. It is one of the most common ways of replacing tissue in the head and neck, particularly after mouth cancers have been removed. It can be used to replace large parts of the mouth and has the advantage that when it heals it does not shrink so that hopefully speech and swallowing will not be greatly affected. For the procedure, a surgeon takes a piece of skin from the inside surface of the patient's forearm near the wrist. The skin and fat layer in this region are removed (the flap) along with two blood vessels, one of which supplies blood to the flap (the artery) and one of which drains blood from it (the vein). The vessel which supplies blood to the flap is the artery which gives rise to the pulse at the wrist at the base of the thumb. Once the flap of skin is raised it is transferred to the head and neck and sewn into the hole created by the removal of the cancer. The blood vessels supplying and draining the flap are then joined to blood vessels in the neck under a microscope. These blood vessels then keep the flap alive while it heals into its new place. Once the flap is removed from the forearm the hole created is covered with a graft of skin. This graft of skin can be taken from one of several places. Commonly a thin piece of skin is shaved from the arm above the elbow. Alternatively, some skin will be borrowed from the stomach. This highly illustrated colour atlas is a comprehensive guide to head and

neck reconstruction using free radial artery forearm flap. Beginning with an introduction to the history of the technique and its advantages and disadvantages, the book then provides step by step guidance on surgical anatomy, pre- and post-operative care, surgical procedures, and potential complications. A selection of case studies is included to assist learning. A Colour Atlas of Cleft Lip Surgery

This is a revision of Cawson's Oral Pathology and Diagnosis, published in 1987. Each chapter has been updated by revising the text in order to include new information (eg AIDS-related oral manifestations, developments in diagnostic techniques and therapeutics) and clarify existing text where appropriate, and by the inclusion of new colour slides (clinical photographs, gross pathology, histology) and radiographs. In addition, the organization of the book has been modified to reflect current thinking (eg multiple myeloma and solitary plasma cytoma are now covered in the chapter on nonodontogenic tumours, rather than in that on diseases of the haemopoietic tissues and lympho-reticular system).
