Textbook of Liver Transplantation

Liver transplantations require a complex and varied, multidisciplinary approach involving not only hepatologists and surgeons but also pathologists, psychologists, professional educators, nurses and, in the case of young patients, also pediatricians and development experts. This textbook provides an overview of the management problems involved in liver transplantation for acute and chronic liver disease, pediatric liver transplantation and the psychosocial aspects of liver transplantation. A closing chapter, focusing on the developments and future prospects in liver transplantation, outlines the potential offered by donors after cardiac death, cell therapies and organogenesis. The multidisciplinary approach is also maintained in the selection of authors, all experts actively engaged in the various disciplines involved in liver transplantations. This aspect, together with its precise and didactic descriptions of all phases of liver transplantation for chronic and acute diseases – from managing waiting lists to post-transplant complications – make the book a valuable tool for fellows, trainees, and specialists in the field seeking accurate framework for liver transplantation in its many facets.

Atlas of Liver Transplantation

This book is the first to provide balanced examination of both pediatric liver disease and liver transplantation – two topics that are inherently related, given that most chronic liver disorders eventually require organ replacement. The different forms of liver disease encountered in the pediatric age group are first discussed in a series of disease-specific chapters that have a reader-friendly, uniform structure covering pathophysiology, diagnostic and treatment algorithms, clinical cases, and transition to adult care. Key topics in the field of liver transplantation are then addressed. Examples include indications and contraindications, surgical techniques and complications, immunosuppression, in pediatric liver transplantation, acute and chronic rejection and allograft dysfunction, and CMV and EBV infection in transplant recipients, long-term graft injury and tolerance. A section on pediatric hepatology across the world includes chapters presenting the features and management of pediatric liver disease in South-America, Africa and Asia. A closing section considers what the future holds for pediatric liver disease and its management, including novel genetic testing, cell therapy and gene therapy. Pediatric Hepatology and Liver Transplantation will be of value for a range of practitioners, from residents making their first approach to pediatric liver disease through to specialists working in transplantation centers.

Atlas of Liver Pathology E-Book

Liver Transplantation: Challenging Controversies and Topics grew out of a need I perceived within the fields of transplant hepatology and liver transplantation. Liver transplantation has rightly gained recognition as an established therapy for end-stage liver disease. Few would argue that liver transplantation is one of the few truly lifesaving and life-altering treatments within medicine and surgery. Not many realize that 20 years passed from the time of the first human liver transplantation in 1963 to its acceptance as therapy by the 1983 NIH Consensus Conference on Liver Transplantation. In 2008, 25 years will have passed since the 1983 NIH conference—a mere 25 years for a field that has provided patients hope, doctors options, and to some the “gift of life.” Many issues in liver transplantation involve indications, patient selection, and outcomes after transplantation—these are standard topics, covered by textbooks of hepatology and transplantation. In contrast, the field of liver transplantation is young, evolving, dynamic, and issues and decisions are often controversial. Thus, Dr. Trotter and I, as well as our colleagues at the University of Colorado, felt that a text with a different focus was required, one that highlighted controversy and challenged dogma. Out of this perceived need emerged Liver Transplantation: Challenging Controversies and Topics. To meet the transplant community's need for emerging information about liver transplantation, Dr. Larry Chan, Dr. Igal Kam, and I initiated the Controversies in Transplantation Conference.

Split Liver Transplantation

In the past, liver resections and liver transplantations were performed by different surgical teams, with very little interplay between the two. However, the evolution toward more complex operations called for an increasingly intense interaction between these surgical techniques: split liver and living donor liver transplantation have become popular in the transplant community, utilizing the Couinaud segmental anatomy in a very sophisticated way, while portal and arterial resection and reconstruction have become indispensable methods for treating Klatskin tumors infiltrating the hepatic hilum. This book offers a complete overview of the connections between liver transplantation and hepatobiliary surgery. It focuses on ex situ techniques for resection of tumors at the suprahepatic confluence, with or without venous reconstruction, and on total vascular exclusion of the liver with the aid of a venovenous bypass that should be a surgical option for referral centers in hepatopancreatobiliary surgery. By taking into consideration the development of minimally invasive liver surgery, it will introduce readers to a variety of new perspectives such as: vascular exclusion techniques with or without extracorporeal circulation, hemodynamic implications and lessons learned from liver transplant surgery, and technical details on pediatric transplantation and its informative role in modern biliary tract surgery. .

Liver Failure

This edition stresses not just the diagnostic cytological features of the various conditions encountered, but also the diagnostic pitfalls and the grey areas between so as to enable the reader to give more evidence-based reports. In recognition of their rapid expansion, there are new chapters on recent technological developments and on the cytodagnosis of childhood tumours. A special section on the importance of multidisciplinary team meetings that include the cytopathologist as a core member of the team has also been included at the end of each chapter. As active members of this team, cytopathologists can define their role in the management pathway and thus bring the patient and the microscope together as never before. The full text can be accessed online and images downloaded via Expert Consult.

What next? The Consultation is due to run until the middle of December 2014. The aim is to have approved standards and specifications by March 2015 Once agreed all providers will be expected to meet the
