This book focuses on the real-world application of the Philosophy for/with Children (P4wC) pedagogy to cultivate reasonableness in individuals through communities of philosophical inquiry. It presents a collection not only of theories but, more importantly, of experiences, discoveries, and innovations on P4wC by scholars, trainers, advocates, and practitioners around the world. Each chapter provides readers with insights and lessons that have resulted from the continuous application, exploration, and enrichment of the concepts, principles, and practices that were developed by Matthew Lipman and Ann Margaret Sharp into what P4wC is today - a dialogic pedagogical approach that may just be what is needed at a time when reasonableness and dialogue are essential to maintaining global stability and progress. In this light, this book also looks into how the P4wC approach can be practiced with adults such as when it is employed in various settings or contexts such as in business consulting, textbook writing, peace education, and extremism prevention, among others. Furthermore, this book also features chapters that discuss how the P4wC pedagogy can be beneficial once integrated into processes such as classroom teaching, teacher education, bioethics, and employee education. This book provides valuable insights about how reasonableness that is cultivated through building communities of philosophical inquiry in education can be a powerful tool for nation-building and social transformation.

Intro

Introduction to Genetic Screening

Scientists can genetically screen individuals by locating specific alleles of a gene using DNA probes
DNA probes are used to locate a mutant allele which causes a specific disease using the following stages: 1 The sequence of the mutant allele is determined by DNA sequencing or by finding the DNA sequence in a genetic

A probe is made by synthesising a fragment of DNA that has a complementary base sequence to the mutant allele

This DNA probe is labelled with a fluorescent marker

The DNA probe is then amplified using PCR to produce many copies of the probe

Many copies of DNA from the person being screened are then heated until they denature and separate into single strands

If the individual contains the mutant allele, the probes will bind to the DNA fragments that are complementary in a process called hybridisation

The hybridised DNA can then be detected because of the
