Which of the following metabolic compounds is composed of only carbon, oxygen, and hydrogen? a. Phospholipids b. Glycogen c. Peptides

B: Glycogen is a polysaccharide, a molecule composed of many bonded glucose molecules. Glucose is a carbohydrate, and all carbohydrates are composed of only carbon, oxygen, and hydrogen. Most other metabolic compounds contain other atoms, particularly nitrogen, phosphorous, and sulfur.

B: Some RNA molecules in extant organisms have enzymatic activity, for example the formation of peptide bonds on ribosomes is catalyzed by an RNA molecule. This and other information has led scientists to believe that the most likely molecules to first demonstrate enzymatic activity were RNA molecules.

C: Chloroplasts contain the light-absorbing compound chlorophyll, which is essential in photosynthesis. This gives leaves their green color. Chloroplasts also contain yellow and red carotenoid pigments, which give leaves red and yellow colors in the fall as chloroplasts lose their chlorophyll.

ANSWER B: The sublimation of dry ice, that is the transition directly from a solid to a gas, represents a change in the physical state of carbon dioxide. No chemical bonds are broken or formed in the process. In contrast, fermentation (conversion of sugar to alcohol), baking, digestion of food, and a tomato ripening all involve one or more changes in the chemical composition of a complex mixture.

ANSWER A: Reactions can be classified as to whether they yield (exothermic) or require energy (endothermic). The difference in energy in these cases is positive and negative, respectively, and is generally termed the heat of reaction. The transition and activation energies refer to the energy needed for specific molecular changes in the overall reaction.
