Report on the Nomenclature and Statistical Classification of Diseases for Statistical Returns. [by W. Farr]... - Primary Source Edition

"When and how did public health become modern? In *Governing Systems*, Tom Crook re-examines this key question in the context of Victorian and Edwardian England, long regarded as one of the 'homes' of modern public health. The modernity of modern public health, Crook argues, should be located not in the rise of a centralized, bureaucratic and disciplinary State, but in the contested formation and intricate functioning of systems of governing, from the administrative to the technological. Equally, we need to embrace a dialectical understanding of modern governance, one that is rooted in the interaction of multiple levels, agents and times. Theoretically ambitious, but empirically grounded, *Governing Systems* will be of interest to historians of modern public health and modern Britain, as well as anyone interested in the complex gestation of the governmental dimensions of modernity"--Provided by publisher.

Thirty-third annual report ... abstracts for 1870 includes "summary of marriages, births and deaths registered in ten years 1861-70".

Annual report of the registrar-general of births, deaths, and marriages in England. v. 16, 1853

This book describes the development of economic, demographic and social statistics in the British Isles from the mid-seventeenth century to the end of the nineteenth as represented by the work of twelve pioneers in these fields. Its most distinctive feature is its tables, which bring together in clear and succinct form an impressive body of data collected from a large number of disparate sources and are complemented by an exhaustive description of their historical context. An important aspect of the book is the short biographies that open each chapter and bring to life the personalities of its central characters.

This new edition of WHO's International Classification of Diseases, 10th Revision (ICD-10) has been fully updated for the third time. In addition, the numbering system has changed and now clearly indicates the year that the updates were incorporated. Changes in this new edition include for Volume 1 extensive corrections for Lymphomas and Leukaemias in the neoplasms chapter, clarification and added details for some maternal conditions and various edits. For Volume 2, main changes include clarification of definitions and rules around maternal cases, causes of pneumonia and extensive editing of the unchanged rules for coding neoplasms in causes of death. For Volume 3, all the new terms and changes made in Volume 1 have been reflected. The ICD is the international standard diagnostic classification for all general epidemiological purposes, many health management purposes and clinical use. These include analysis of the general health situation of population groups and monitoring the incidence and prevalence of diseases, as well as other health problems with respect to variables such as the characteristics and circumstances of the individuals affected, reimbursement, case-mix, resource allocation, quality, patient safety, and guidelines. ICD is used for health information purposes in public health, primary, secondary and tertiary care settings. In particular, it is used to classify diseases, accidents, reasons for encounter, and other health problems recorded on many types of health and vital records including death certificates and health records. The records form the basis for compiling national mortality and morbidity statistics by WHO Member States.

Statistics of divorce are included beginning with 1882.

International Statistical Classification of Diseases and Related Health Problems: Alphabetical index

This book will provide readers with the essential information needed to understand knowledge representation with a focus on healthcare. The book will use health sector real world examples to delineate the principal issues and solutions for the field of data representation. The book will include a history of terminologies and in particular their use in healthcare. This book will cover the basis, authoring and use of reference terminologies including the formalisms needed to use them safely. The editor will exhaustively cover the field of concept-based indexing and will provide readers with an understanding of natural language processing and its application to health terminologies. The book will discuss terminology services and the architecture for terminological servers. This text will serve as the basis for a course or equally well as a reference text.

The International Statistical Classification of Diseases and Health Related Problems ICD-10

This revised new edition containing numerous new and heavily updated chapters provides readers with the essential information needed to understand the central topics of terminology in healthcare, the understanding of which is an asset to be leveraged in care and research. Twenty-five years ago the notion that terminology should be concept-based was all but unknown in healthcare; now almost all important terminologies are at least partly concept-based. With no general model of what a terminology was or should be, there were no tools to support terminology development and maintenance. Steady progress since then has improved both terminology content and the technology and processes used to sustain that content. This new edition uses real world examples from the health sector to delineate the principal issues and solutions for the field of data representation. It includes a history of terminologies and in particular their use in healthcare, including inter-enterprise clinical and research data aggregation. Terminology, Ontology and their Implementations covers the basis, authoring and use of ontologies and reference terminologies including the formalisms needed to use them safely. The editor and his team of carefully chosen contributors exhaustively reviews the field of concept-based indexing and provides readers with an understanding of natural language processing and its application to health terminologies. The book discusses terminology services and the architecture for terminological servers and consequently serves as the basis for study for all students of health informatics.
