Test of a EGR valve cleaner kit without dismantling (Diesel engine)

The product which will be tested is a professional product for professional use

According to the **manual**., the **engine**, mileage must be ...
The vehicle which will be tested has exceeded this limit (113 602 miles)
Here the valve before cleaning
The valve refitting
The kit contains an EGR valve aerosol cleaner and an EGR valve diesel additive to add into the fuel tank
The aerosol must be pulverized between the air filter and the intake manifold, after the air-flow sensor
This vehicle does not have an air-flow sensor (Renault Megane 1), the spraying is performed directly after the air filter
This vehicle has an air-flow sensor (Peugeot 206 hdi), the spraying is performed after the air-flow sensor
Disconnect the air intake pipe
Spray 3 or 4 short bursts of 1 second maximum into the air intake pipe
Wait-1-minute between each spray while changing engine speed from 1000 to 3000 rev / min
Renew the operations until exhaustion of the aerosol by doing a pause all the 10 times
Pause the tenth time
Then resume operations
Engine speed between 1500 and -2000 rpm
Stop when the aerosol is empty
Refit the air intake pipe
Pour the diesel additive in 20 liters of fuel
Drive for 10 miles while regularly increasing engine speed to 3000 rpm
Removing the EGR valve to judge the effectiveness of the product (this is not done in the normal operating mode!)

Despite the too high mileage of the engine (110 000 miles); it is noted that the product managed to eliminate the main impurities
If a fault indicator is displayed on the dashboard, ask a mechanic to erase the fault code with a diagnostic tool

Intro

A new engine got installed and the customer paid for it.

Brake pads and brake rotors were too small. Always check the old ones you are taking off when replacing brake pads, rotors, and other parts. Could save you a lot of time and money.

The customer failed the inspection again and told the customer they need to be repaired properly.

The customer decided to get the shop to install new brake rotors and pads.

The customer did not know they had a spare key in the center console as they said they thought they left a spare key in the safe at home.

An inline fuse should be installed for the power cable for the amp and as close to the battery as possible. The customer declined repairs for the sound system.

The rattling noise was caused by the upper control arms. The technician had to remove the medals pinched between the glove box to find the noise.

There was not a cabin air filter where the engine air filter should be, in case you are wondering.

Hubcap and center cap. The technician said was wondering why.

No extra info.

Ford Focus with dual-clutch automatic transmission. Had the typical transmission shudder. Since the vehicle was bogging down due to the "spinny thing" he could not accurately diagnose the issue using a scan tool.

Mass airflow (MAF) sensor was not installed. It measures the amount of air entering the engine.

The technician has no clue how this got here and said he definitely did not fake this as he is flat rate (paid by the job, not hourly).

The technician said he has no clue why somebody would put JB weld on an engine oil filter as they are fairly cheap, and if it leaked out all the oil while driving the customer would have most likely needed a new engine.

The shop welded the differential axle tubes and plugs.

The technician said this was on a Jeep but did not mention the model. Also apparently "another shop" did this. The technician told the customer to bring it back to that shop and never heard back from the customer after that.

The technician didn't mention or was informed of what happened.

The vehicle came in for a recall.
