

adolescent development and pathways to problem behavior 1

[#Adolescent development](#) [#Problem behavior](#) [#Teenage behavior](#) [#Risk factors](#) [#Developmental pathways](#)

Explore the complex relationship between adolescent development and pathways leading to problem behavior. Understanding the key developmental stages, risk factors, and potential triggers is crucial for creating effective interventions and promoting positive outcomes for teenagers. This resource provides insights into the various factors that contribute to adolescent behavior, aiming to empower parents, educators, and healthcare professionals with the knowledge needed to support healthy development.

Adolescent Development and Pathways to Problem Behavior

The transitional teen model defines four key elements that significantly affect and influence behavior: (1) the developmental dynamics and status of the adolescent; (2) parental influence; (3) social, environmental, and community influences; and (4) peer influences. The latter three are considered to be external.

Adolescent Development and Pathways to Problem Behavior

Nasir LenAmalia MadihieS. M. Yusoff. Psychology. 2020. PROFESSIONALS— Evidence-Based Treatment for Depression in Adolescence (PART 1) - PROFESSIONALS— Evidence-Based Treatment for Depression in Adolescence (PART 1) by Effective Child Therapy 454 views 4 years ago 58 minutes - ABOUT WORKSHOP: Dr. Curry reviews cognitive **behavioral**, strategies that were used in the **Treatment**, for **Adolescents**, with ...

Disorder A set of symptoms A certain severity and duration of symptoms An expectable course A significant and persistent change in the child's functioning

Five or more of the following, most of the day, most days, for at least 2 weeks: Depressed or irritable mood Loss of interest or pleasure Appetite or weight gain or loss Insomnia or hypersomnia Psychomotor agitation or retardation

Fatigue or loss of energy Excessive guilt or worthlessness Diminished ability to think, concentrate, decide Recurrent thoughts of death, recurrent suicidal ideation, or a suicide attempt or plan

Dysthymic Disorder: a milder but prolonged depression • Depressed or irritable mood, most days, for 1 year 2 of the following when depressed: Poor appetite or overeating Insomnia or hypersomnia Low energy or fatigue Low self-esteem Poor concentration or difficulty making decisions Feelings of hopelessness

Oregon Adolescent Depression Project (Lewinsohn et al., 1993) High School Students Point prevalence of adolescent MDD: 2.57% Lifetime prevalence: 18.48%

Prevalence under age 13: Prevalence for girls, ages 13-18: Prevalence for boys, ages 13-18

In children, approximately equal gender distribution In adolescents, from age 14, as in adults depressed females outnumber depressed males as much as 2:1

Kovacs (1996) (clinical sample): Children with MDD had median duration of 9 months Children with DD had median duration of 4 years

At TADS baseline, mean duration of MDD was 70 weeks • Median duration of MDD was 40 weeks

In outpatient treatment samples, about 6-8% of MDD youths have bipolar outcome Among inpatient samples, rate can go as high as 20% Childhood onset; psychotic depression; hypomanic response to anti-depressant medication, and family history of bipolar disorder are risk factors for bipolar outcome

Diagnostic Process: Interviews, Questionnaires, and Rating Scales Unstructured clinical interview

Semi-structured diagnostic interview, e.g., K. SADS-PAL (Kaufman et al., 1996), available on-line for not-for-profit clinical settings Questionnaires: BDI, RADS, CDI; CTI: BHS

Allows adolescent and parents to present their concerns, and to tell their stories Permits patients to make linkages between depressed mood and precipitants • Builds rapport Structure it enough that you cover core elements of any intake or initial interview, e.g., strengths, interests, family, peers, school, activities

Conners-March Developmental History Child Neuropsychological History Form Yields information on early temperament, developmental milestones, school adjustment Include current and past

medications, psychological treatments Include family history of psychiatric disorders
Have you ever felt sad, blue, down, empty? Did you feel like crying? Did you have any other bad feelings? Did you have a bad feeling all of the time that you could not get rid of? Did you cry or were you tearful?

No need to read probes verbatim • Adjust language for child, parent, or for cultural considerations • Use the language of the child or parent Do not read the anchors to the child or parent as if they were probes

During the initial open-ended portion of the interview (to be discussed), try to construct a time line of episodes, including onset estimates Edit this time line as you go through the more detailed semi-structured portion with parent and child

Sequence of Parent and Child K SADS-PL Interviews For adolescents, recommendation is to interview adolescent first, and then interview parent For children, recommendation is to interview parent first, and then interview child My preference is to conduct the initial unstructured portion with adolescent & parent

Initial unstructured Clinical Interview Screen Interview Diagnostic Supplements Mood; Anxiety: Psychosis; Eating; Disruptive Behavior; Tics . Summary Diagnostic Checklist Children's Global Assessment Scale

Criteria for a 'Disease: symptoms (phenomenology), course, laboratory markers genetic or biological basis, response to specific treatment Is MDD a disease? . Symptoms by now well-established (since about 1980) . Genetic basis, reflected in family history, is probable, but less robust than for bipolar disorder Course is highly variable

Unless she likes me, I am unlovable Core Beliefs in Depression

Faulty information processing Underdeveloped self-schemas Cognitive Distortions All or none thinking Discounting the positive Making the relative absolute (should/must) Overgeneralization

Early experiences in the family or with other significant persons provide the basis for forming negative concepts about self, world, and future These may remain latent • They are then activated by a current life experience

Lewinsohn's Multifactorial or Behavioral Model Depression is a function of lack of positive reinforcement, especially social reinforcement Poor social skills or lack of involvement in pleasant, reinforcing activities, leads to this deficit in experiences of positive reinforcement

Behavior affects thoughts and emotions Thoughts affect behavior and emotions It is easier to change behavior or thoughts than to change emotions directly Depressed patient needs to learn new skills

What additional elements can be part of CBT for adolescent depression? . Factors that influence the depression in this particular case Social skills/deficits Emotion regulation skills/deficits . Family processes
