a Day for 4 Weeks · <https://youtu.be/ofqqOeZ93I4>How To Build ...

So number one is that alcohol itself carries a caloric value, which means one gram of alcohol has seven calories. So if you're on a calorie diet, if you count your calories, means that whatever amount of alcohol you drink, you will need to add into your calorie account. So just to compare, carbohydrates and protein have around four calories a gram, and fat has nine calories a gram.

Number two, and this is, I think, the most important bit. I really want you to understand this point, so make sure you pay attention. Another wink here. So alcohol has no nutritional value, which means your body cannot use it at all. So the first thing your body wants to do is get rid of it. Because it has no nutritional value means also your body cannot store it. So what happens? As you drink alcohol, it's getting broken down by your liver, and now, let's think about the liver, and this is the important bit I want you to get, because you're going to realize in a second. Now your liver breaks down the alcohol, metabolizes it on a basis of one unit per hour, breaks it down, which is fine. That sounds good...

Number three, alcohol is a toxin, and as it is a toxin, it affects or damages our stomach linings, the intestines, your kidneys, and your liver. Now why is that bad, and how does that affect your weight loss? Well, when you think about it, if you eat food, most of the time it will get broken down in your stomach a little bit, then in the small intestine, large intestine, and so on.

Number four, alcohol lowers testosterone. Now testosterone is known as the hormone or our muscle-building hormone in your body, and also as sort of a fat-burning hormone. Now I'm not going to go into more detail about it, but how does that translate? Well, if you have more muscle in your

body, it raises your metabolic rate, and as you have a higher metabolic rate, you will burn more fat.
