The Measurement of Population Distribution

With special reference to India.

Population, Distribution, and Policy

Population geography is a division of human geography. It is the study of the ways in which spatial variations in the distribution, composition, migration, and growth of populations are related to the nature of places. Population geography involves demography in a geographical perspective. It focuses on the characteristics of population distributions that change in a spatial context. Examples can be shown through population density maps. A few types of maps that show the spatial layout of population are choropleth, isoline, and dot maps. Population distribution means the pattern of where people live. World population distribution is uneven. Places which are sparsely populated contain few people. Places which are densely populated contain many people. Sparsely populated places tend to be difficult places to live. These are usually places with hostile environments e.g. Antarctica. Places which are densely populated are habitable environments e.g. Europe. Population density is a measurement of the number of people in an area.

Matrix Analysis of Interregional Population Growth and Distribution

Concentrates on both applied demographic and planning techniques which rely upon geographical aspects of population data. Describes methods used to assess the impact of population change on facility demand, school enrollment, changes in product market, transportation and recreation demand forecasting. Applied problems expose students to hands-on planning problems. Questions and solutions use actual data.

The Population Dilemma

A basic model in population age structure is studied and then applied and extended to several population phenomena.

Distribution and Growth of Population in India Since Independence

Monograph of essays on the interrelationship between population dynamics variables and economic development, particularly as it affects the national planning process - covers educational planning, human resources planning, economic planning, social planning, family planning, etc. Flow charts, graphs, references and statistical tables.

POPULATION GEOGRAPHY

Quality-adjusted population density (QAPD) is population divided by land area that has been adjusted for geographic characteristics. We derive weights on these geographic characteristics from a global regression of population density at the quarter-degree level with country fixed effects. We show, first, that while income per capita is uncorrelated with conventionally measured population density across countries, there is a strong negative correlation between income per capita and QAPD; second, that the magnitude of this relationship exceeds the plausible structural effect of density on income, suggesting a negative correlation between QAPD and productivity or factor accumulation; and third, that higher QAPD in poor countries is primarily due to population growth since 1820. We argue that these facts are best understood as results of the differential timings of economic takeoff and demographic transition across countries, and particularly the rapid transfer of health technologies from early to late developers.
