Get vaccinated even if you have had COVID-19 - Get vaccinated even if you have had COVID-19 by World Health Organization (WHO) 1,443,284 views 2 years ago 24 seconds – play Short - For more information: <https://www.who.int/emergencies/diseases/novel-coronavirus-2019/covid-19-vaccines>,/advice.

This is because we don't know how long the immunity from getting the disease lasts.

Think of the vaccine as a booster to protect you longer

Always remember to follow these 5 precautions, even after getting vaccinated.

HEALTHCARE TRIAGE

There are two general sides to the immune system coin-the innate immune system and the adaptive immune system.

The innate immune system is rapid and nonspecific, meaning it reacts within minutes to hours to any potentially harmful antigen it detects.

The innate immune system includes physical barriers such as your skin as well as several cellular components including white blood cells called macrophages that swallow and digest things like foreign material and dead or dying cells.

The adaptive immune response is mobilized by the innate immune system when it cannot neutralize an infection on its own.

In short, antibodies are proteins that recognize the antigens for which they were made, attaching to and neutralizing them to prevent them from causing you harm.

There are, of course, other cellular components involved in the adaptive immune response, but T and B Cells are the only cells that can specifically recognize and respond to individual antigens.

Vaccines imitate infection in order to develop the host's immunity to a particular disease, but they do it without causing severe illness.

Toxoid vaccines prevent disease via use of a weakened form of the toxin produced by a disease-causing germ. Diphtheria and tetanus vaccines are good examples.

And lastly, conjugate vaccines fight off bacteria whose antigens are coated with long chains of sugar molecules called polysaccharides.

Herd immunity, of course, is when a large portion of the population is immune to a disease, thereby limiting spread and indirectly protecting those who are not immune.

How Your Clothes Affect Our Speed of Vaccination

The vaccine is administered in the upper arm (deltoid muscle of the arm), so clothing with easy access to the upper arm will make administration of the vaccine much easier.

Also, considering the Vaccination areas don't have space for changing rooms wearing inaccessible long sleeved clothes can cause delays and make the whole process inconvenient for you
