Chapter 11 Angular Kinematics of Human Movement

What is a relative angle? angle at a joint formed between the longitudinal axes of adjacent body

The relative angle at the lead knee tends to be smaller during sprinting than during distance running.

angular orientation of a body segment with respect to a fixed line of

The absolute angle of the trunk with respect to vertical is often a quantity of interest in studies of lifting
as related to low back pain.

What is angular displacement? change in angular position the directed angular distance from initial
to final angular position • the vector equivalent of angular

What is a radian? The size of the angle subtended at the center of a circle by an arc equal in length
to the radius of the circle.

What is angular velocity? • the rate of change in angular position angular displacement

What is angular acceleration? • the rate of change in angular velocity A ang.velocity

What is the relationship between linear and angular displacement? The greater the radius between
a given point on a rotating body and the axis of rotation, the greater the linear distance traveled by

that point during an angular motion.

The larger the radius of rotation (1), the greater the linear distance (s) traveled by a point on a rotating body.

and angular velocity? Since velocity is displacement over time, linear and angular velocity

What is tangential acceleration? . component of acceleration of angular motion directed along a tangent to the

What is radial acceleration? component of acceleration of angular motion directed toward the center of curvature • represents change in
