The new field of experimental philosophy has emerged as the methods of psychological science have been brought to bear on traditional philosophical issues. This book will be the place to go to see outstanding new work in the field. It will feature papers by philosophers, papers by psychologists, and papers co-authored by people in both disciplines. The series heralds the emergence of a truly interdisciplinary field in which people from different disciplines are working together to address a shared set of questions. The inaugural volume is roughly structured into four sections. The first three papers focus on recent developments in moral psychology, a topic that has seen lively debate and a great deal of progress over the last decade. The second section highlights three contributions that bring

new methods to moral psychology: formal modeling and special populations. The third section brings together four papers that adopt an experimental philosophy approach to novel topics, including intuitive dualism, generics, joint action, and happiness. And the last two papers provide critical and historical context to the development of experimental philosophy.

The study of thermoregulation in endotherms has contributed much to the emergence of the concept of control theory in biology. By the same token, the study of temperature adjustment in ectotherms is likely to have a far-reaching influence on ideas on the regulation of metabolism in general. The reason for this is that ectotherms, in adapting to the vagaries of a thermally unstable environment, deploy a range of subtle molecular and organismic strategies. Thus the experimenter, using temperature changes as a tool, is well equipped to analyze some of these strategies. This approach has enabled some important mechanisms of temperature-induced adaptation to be elucidated; the most striking of these are the effects on metabolism of changes in the conformation of enzymes and the transfer properties of membranes. Furthermore, there is a vague but persistent feeling among those working in this field that changes in the nervous system will ultimately prove to be the agency by which many of the molecular mechanisms of temperature adaptation are controlled. Should this indeed be the case, a new phase would soon begin in our understanding of the interactions between the systemic and the cellular levels

of organization. However, it is not only questions about the causes of temperature adaptation that can provide answers of potential importance to the general biologist; of equal significance are questions as to the meaning of temperature adaptation in a particular organism.

This textbook on Systems and Control has been designed for 3rd-4th year course in undergraduate engineering. The emphasis has been on conceptual problems, rather than long descriptive passages. Modern methods, such as state equations, root locus, PID control, etc. have been included. Translational and rotational mechanical systems have been studied as analogies. The material is easy-to-understand, and yet builds depth-of-knowledge. The objective has been to prepare the graduating engineer for complex real-life systems and control issues.

This fascinating book analyzes 13 control failures in human history, from Robespierre's promotion of the French Revolution, to Hoover's efforts to stop the Great Depression, to the intelligence failures of 9/11. Assessing the causes of 10 additional historical cases, the author's comparative analysis shows how each leadership failure was caused by an expansion of the range of control attempts, their scope, and/or their diversity. A leader's or other actor's attempts to broaden the range of control targets have been most important in causing great human failures. The analysis is timely during an era when war, global warming, and other vexing problems plague our society.
