A wave is a disturbance that travels through a medium, transferring energy from one point to another, without causing any permanent displacement of the medium.

Mechanical waves are waves that require a material medium for their propagation. eg-water waves, sound waves. waves on a rope or string.

Electromagnetic waves are waves that do not require a material medium for their propagation. eg - X-rays, light waves, radio waves and gamma rays.

Transverse waves are waves that travel in a direction perpendicular to the direction. of the disturbance/vibration causing the wave. eg - water waves, light waves and radio waves etc.

Longitudinal waves are waves that travel in a direction parallel to the direction of the disturbance/vibration causing the wave. - sound waves, Tsunami waves and microphone waves etc.

Amplitude is the maximum vertical displacement of a wave particle from it's rest position.

Wavelength is the distance between two successive crest or trough of a wave.

Frequency is the number of complete vibration or cycle that a particle make in one second. measured in Hertz (Hz)

Period is the time taken by a wave particle to complete one oscillation.

The distance between two successive crest of a wave is 15cm and the velocity is 300m/s. Calculate the frequency.
