[#Christianity](#) [#Science](#) [#Religion](#) [#Faith](#) [#Reason](#)

The relationship between Christianity and science has been a complex and evolving one throughout history. While some perceive conflict between faith and reason, others see harmony and complementarity. Examining historical interactions, philosophical perspectives, and contemporary dialogues reveals diverse viewpoints on how these two domains intersect and influence each other, shaping our understanding of the world and our place within it.

On the relation between religion and science

Since the publication in 1896 of Andrew Dickson White's classic *History of the Warfare of Science with Theology in Christendom*, no comprehensive history of the subject has appeared in the English language. Although many twentieth-century historians have written on the relationship between Christianity and science, and in the process have called into question many of White's conclusions, the image of warfare lingers in the public mind. To provide an up-to-date alternative, based on the best available scholarship and written in nontechnical language, the editors of this volume have assembled an international group of distinguished historians. In eighteen essays prepared especially for this book, these authors cover the period from the early Christian church to the twentieth century, offering fresh appraisals of such encounters as the trial of Galileo, the formulation of the Newtonian worldview, the coming of Darwinism, and the ongoing controversies over "scientific creationism." They explore not only the impact of religion on science, but also the influence of science and religion. This landmark volume promises not only to silence the persistent rumors of war between Christianity and science, but also serve as the point of departure for new explorations of their relationship. Scholars and general readers alike will find it provocative and readable.

God and Nature

Have science and Christianity been locked in mortal combat for the past 2000 years? Or has their relationship been one of peaceful coexistence, encouragement, and support? Both opinions have been vigorously defended, widely disseminated, and hotly debated. And both have been rejected by knowledgeable historians as unacceptable oversimplifications of the historical reality. This book steps back from those debates, abandoning, for the present, the attempt to formulate or defend generalizations of such breadth and scope. Its authors believe that every encounter had its own peculiar shape and that each must be examined uniquely before broader attempts at generalization are

likely to succeed. This book, in language accessible to the general reader, investigates twelve of the most notorious, most interesting, and most instructive cases, aiming to tell each story in its historical specificity and local particularity. Among the episodes treated in *When Science and Christianity Meet* are the Galileo affair, the 17th-century clockwork universe, Noah's ark and flood in the development of natural history, struggles over Darwinian evolution, debates about the origin of the human species, and the Scopes trial. Readers will be introduced to St. Augustine, Roger Bacon, Pope Urban VIII, Isaac Newton, Pierre-Simon de Laplace, Carl Linnaeus, Charles Darwin, T. H. Huxley, Sigmund Freud, and many other participants in the historical drama of science and Christianity. Contributors: *William B. Ashworth Jr. *Thomas H. Broman *Janet Browne *Mott T. The Relations Between Religion and Science

All too often scholars of science and religion have focused their attention almost exclusively on the Christian experience. At a time when religious ignorance and misunderstanding have lethal consequences, such provincialism must be avoided. This book expands our knowledge of science and religion beyond its largely Christian base to include the other Abrahamic faiths and the indigenous traditions of Africa and Asia.

When Science and Christianity Meet

The book of "Science and Christian Faith: Their Relationship in the Past, Present and Future" is a book dealing with natural sciences and my personal, evangelical Christian faith, their relationship in time of past, present and future." It is a semi-science popular reference book. In western civilization, Christianity and science are historically two Rocks. Christianity was borne when Jesus commenced his ministry among the Jewish people. In a short period of time, Christianity was popularized by his disciples; and extended to the other parts of the world. So, we have Christianity and her ecclesiastic doctrines; and his followers as Christians and Christian Church. In 16-17th centuries, modern experimental sciences were borne. Three Christian scholars, i. e. Nicholas Copernicus, Johannes Kepler and Galileo Galilei first formulated the helio-centered universe. Thereby, Christianity was the mother of experimental sciences. In addition, Galileo even suggested a metaphor of Two Books, explaining the mutually explainable relationships between science and faith. Unfortunately, the Roman Catholic Church made a mistake by condemning Galileo as heretic, then to house arrest and consequently died of old age. This left a bad taste in the mouth of scientists. With this, a schism between Christian faith and science was created. In 1858, Charles Darwin published his "Origin of Species" with an "evolution theory." The "War Hypothesis" between these two scholarly disciplines was proposed by two American scholars. Several American atheists contributed their efforts to make the conflict being even worsen. All these have been extended to the 21st century. Beginning in early years of 20th century, eminent scholars such as Albert Einstein, John Polkinghorne, Bernard Ramm and many others endeavored to build bridge of mutual understanding and reconciliation between the two camps. Einstein said that "All religions, arts and sciences are branches of the same tree. All these aspirations are directed toward ennobling man's life from the sphere of mere physical existence, and leading the individuals towards freedom." The US National Academy of Sciences endorsed Einstein's conviction. In recent years, British and American scholars and theologians, following both Galileo's metaphor of two books and Einstein's conviction (as given above) have continued to build bridges of mutual understanding and conciliation between science and Christian faith. My book on "Science and Christian faith" is written as wee contribution to this noble undertaking.

Science and Christian Faith

In this 1991 volume, John Hedley Brooke offers an introduction and critical guide to one of the most fascinating and enduring issues in the development of the modern world: the relationship between scientific thought and religious belief. It is common knowledge that in western societies there have been periods of crisis when new science has threatened established authority. The trial of Galileo in 1633

and the uproar caused by Darwin's *Origin of Species* (1859) are two of the most famous examples. Taking account of recent scholarship in the history of science, Brooke takes a fresh look at these and similar episodes, showing that science and religion have been mutually relevant in so rich a variety of ways that no simple generalizations are possible. A special feature of the book is that Brooke stands back from general theses affirming 'conflict' or 'harmony', which have so often served partisan interests. His object is to reveal the subtlety, complexity, and diversity of the interaction as it has taken place in the past and in the twentieth century.

The Relations of Science and Religion

Science and Christianity is an accessible, engaging introduction to topics at the intersection of science and Christian theology. A philosophically orientated treatment that introduces the relationship of science to Christianity and explores to what extent the findings of science affect traditional Christian theology. Addresses important theological topics in light of contemporary science, including divine action, the problem of natural evil, and eschatology. Historically oriented chapters and chapters covering methodological principles for both science and theology provide the reader with a strong foundational understanding of the issues. Includes feature boxes highlighting quotations, biographies of major scientists and theologians, key terms, and other helpful information. Issues are presented as fairly and objectively as possible, with strengths and weaknesses of particular interpretations fully discussed.

The Blackwell Companion to Science and Christianity

When it comes to relating Christianity to modern Western culture, perhaps no topic is more controversial than the relationship between Christianity and science. Outside the church, the myth of a backwards, anti-science Christianity is very common in popular culture and can poison the well before a fruitful dialogue can begin. Within the church, opposing viewpoints on the relation between Christianity and science often lead to division. *Three Views on Christianity and Science* addresses both types of conflict. Featuring leading evangelical scholars, this book presents three primary options for the compatibility of Christianity and science and models constructive dialogue on the surrounding controversial issues. The highlighted contributors and their views are: Michael Ruse, representing the Independence View - When functioning correctly, science and Christian theology operate independently of each other, seeking answers to different questions through different means. Alister McGrath, representing the Dialogue View - Though the natural sciences and Christian philosophy and theology function differently, they can and should inform each other. Bruce L. Gordon, representing the Constrained Integration View - Science, philosophy, and theology all contribute to our understanding of reality. Their interactions constrain each other and together present an optimally coherent and integrated picture of reality. By engaging with the viewpoints of the contributors, readers will come away with a deeper understanding of the compatibility of science and Christianity, as well as of the positions of those who disagree with

them. Scholars, students, pastors, and interested laypeople will be able to make use of this material in research, assignments, sermons and lessons, evangelism, and apologetics. The Counterpoints series presents a comparison and critique of scholarly views on topics important to Christians that are both fair-minded and respectful of the biblical text. Each volume is a one-stop reference that allows readers to evaluate the different positions on a specific issue and form their own, educated opinion.

Science & Christianity

"The Relations Between Religion and Science" from Frederick Temple. Frederick Temple, english academic, teacher, churchman, and Archbishop of Canterbury (1821-1902).

Science and Christianity

Each world faith tradition has its own distinctive relationship with science, and the science-religion dialogue benefits from a greater awareness of what this relationship is. In this book, members of the International Society for Science and Religion (ISSR) offer international and multi-faith perspectives on how new discoveries in science are met with insights regarding spiritual realities. The essays reflect the conviction that "religion and science each proceed best when they're pursued in dialogue with each other, and also that our fragmented and divided world would benefit more from a stronger dialogue between science and religion." In Part One, George F. R. Ellis, John C. Polkinghorne, and Holmes Rolston III, each a Templeton Prize winner, discuss their views on why the science and religion dialogue matters. They are joined in Part Two by distinguished theologians Fraser Watts and Philip Clayton, who place the dialogue in an international context; John Polkinghorne's inaugural address to the ISSR in 2002 is also included. In Part Three, five members of the ISSR look at the distinctive relationships of their faiths to science: •Carl Feit on Judaism •Munawar Anees on Islam •B.V. Subbarayappa on Hinduism •Trinh Xuan Thuan on Buddhism •Heup Young Kim on Asian Christianity George Ellis, the recently elected second president of ISSR, summarizes the contributions of his colleagues. Ronald Cole-Turner then concludes the book with a discussion of the future of the science and religion dialogue.

A History of the Warfare of Science with Theology in Christendom

How does science enhance faith? Is God relevant in an age of science? Science and Faith: Student Questions Explored investigates the relationship between science and Christianity in a series of thoughtful and accessible articles written by experts. Chosen from InterVarsity's Emerging Scholars Network blog, each chapter addresses common faith- and science-related questions. In part one, Science and Faith delves into why Christians should pursue scientific discovery, as well as the Bible's viewpoint on scientific method and inquiry. Part two begins the conversation on the direct relevance of science to faith and how Christian scientists can talk to their colleagues about their faith, while part three discusses how conversations about science can take place between Christians. Finally, part four explores the history of science and the church and the question How can the history of science encourage the church? While ideal for graduate students who are exploring their faith and their chosen scientific fields, this book can also be used in church settings or as a personal resource. The book provides questions to launch small group conversation about faith/science, whether you're a science PhD, a ministry leader, or an interested layperson. Since each reading is based on questions from real students, it may also be a resource for Christian faculty teaching the sciences. Contributors include Ruth Bancewicz, Gerald Rau, Greg Cootsona, Andy Walsh, and more.

The Relations Between Religion and Science

Science and the Eastern Orthodox Church explores core theological and philosophical notions and contentious topics such as evolution from the vantage point of science, Orthodox theology, and the writings of popular recent Orthodox critics as well as supporters. Examining what science is and why Eastern Orthodox Christians should be concerned about the topic, including a look at well known 20th

century figures that are considered holy elders or saints in the Orthodox Church and their relationship and thoughts about science, contributors analyse the historical contingencies that contribute to the relationship of the Orthodox Church and science both in the past and present. Part II includes critiques of science and considers its limitations and strengths in light of Orthodox understandings of the experience of God and the so called miraculous, together with analysis of two Orthodox figures of the 20th century that were highly critical of science, it's foundations and metaphysical assumptions. Part III looks at selected topics in science and how they relate to Orthodox theology, including evolution, brain evolution and consciousness, beginning of life science, nanotechnology, stem cell research and others. Drawing together leading Orthodox scientists, theologians, and historians confronting some of the critical issues and uses of modern science, this book will be useful for students, academics and clergy who want to develop a greater understanding of how to relate Orthodoxy to science.

Why the Science and Religion Dialogue Matters

An author on the cutting edge of today's theology and science discussions argues that creedal Christianity has much to contribute to the ongoing conversation. This book contains an intellectual history of theology's engagement with science during the modern period, critiques current approaches, and makes a constructive proposal for how a Christian theological vision of natural knowledge can be better pursued. The author explains that it is good both for religion and for science when Christians treat theology as their first truth discourse. Foreword by David Bentley Hart.

The Relations Between Religion and Science

"Has science made religion intellectually implausible? Does it rule out the existence of a personal God? In an age of science can we really believe that the universe has a "purpose"? And, finally, doesn't religion hold much of the blame for the present ecological crisis?" "These questions form the nucleus of today's debate between science and religion. This book is a guide for that debate, identifying the questions, isolating the issues and pointing to ways the questions can be resolved." "There are four possible ways, says John F. Haught, that we can view the relationship between religion and science. First, they can stand in complete opposition - the conflict position. Or, we can believe they are so different that conflict is impossible - the contrast position. A third approach holds that while science and religion are distinct, each has important implications for the other. A fourth way views them as different but mutually supportive."--BOOK JACKET.Title Summary field provided by Blackwell North America, Inc. All Rights Reserved

Science and Faith

This book, first published in 2000, adopts a balanced perspective on the subject to offer a serious examination of both Darwinism and Christianity. He covers a wide range of topics, from the Scopes Monkey Trial to claims about the religious significance of extraterrestrials. He deals with major figures in the current science/religion debate and considers in detail the claims of the new creationism, revealing some surprising parallels between Darwinian materialists and traditional thinkers such as St. Augustine. Michael Ruse argues that, although it is at times difficult for a Darwinian to embrace Christian belief, it is by no means inconceivable. At the same time he suggests ways in which a Christian believer should have no difficulty accepting evolution in general, and Darwinism in particular.

Science and the Eastern Orthodox Church

W. Mark Richardson and Gordy Slack, philosopher and science writer respectively, conducted interviews with twelve of the world's top scientists on subjects ranging from the existence and nature of God to the role of religion and spirituality in modern scientific work. What's revealed is a broad diversity of perspectives on the relationship between science and religion. The approaches are as surprising as they are varied, but all defy the stereotypes embedded in so much of the popular science versus religion debates.

A Christian Theology of Science

At the end of a five-year journey to find out what religious Americans think about science, Ecklund and Scheitle emerge with the real story of the relationship between science and religion in American culture. Based on the most comprehensive survey ever done—representing a range of religious traditions and faith positions—*Religion vs. Science* is a story that is more nuanced and complex than the media and pundits would lead us to believe. The way religious Americans approach science is shaped by two fundamental questions: What does science mean for the existence and activity of God? What does science mean for the sacredness of humanity? How these questions play out as individual believers think about science both challenges stereotypes and highlights the real tensions between religion and science. Ecklund and Scheitle interrogate the widespread myths that religious people dislike science and scientists and deny scientific theories. *Religion vs. Science* is a definitive statement on a timely, popular subject. Rather than a highly conceptual approach to historical debates, philosophies, or personal opinions, Ecklund and Scheitle give readers a facts-on-the-ground, empirical look at what religious Americans really understand and think about science.

Science and Religion

Galileo. Newton. Darwin. These giants are remembered for their great contributions to science. Often forgotten, however, is the profound influence that Christianity had on their lives and work. This study explores the many ways in which religion—its ideas, attitudes, practices, and institutions—interacted with science from the beginnings of the Scientific Revolution to the end of the nineteenth century. Both scientists and persons of faith sometimes characterize the relationship between science and religion as confrontational. Historian Richard G. Olson finds instead that the interactions between science and religion in Western Christendom have been complex, often mutually supportive, even transformative. This book explores those interactions by focusing on a sequence of major religious and intellectual movements—from Christian Humanist efforts to turn science from a primarily contemplative exercise to an activity aimed at improving the quality of human life, to the widely varied Christian responses to Darwinian ideas in both Europe and North America during the second half of the nineteenth century.

The Relations of Christianity and Science

The biggest revolution in our understanding of the physical world since the days of Newton was brought about by the discovery of the elusive and fitful world of quantum theory. Now the insights of Chaos theory offer the prospect of a further revolution, capable of describing a physical world endowed with a genuine openness to the future. In his acclaimed trilogy - *One World*, *Science and Creation* and *Science and Providence* - John Polkinghorne brilliantly transmitted the excitement of these new discoveries to the lay reader and showed how they opened the way to a new a more harmonious relationship between science and religion. Now he returns to the science-theology debate, outlining his position for new readers and pursuing some of the outstanding issues with the same accessibility, clarity and insight that made the trilogy such an outstanding success.

Faith in Science

How do we react to the claim that physics must now be regarded as one of the liberal arts, for in its description of the universe it sets the stage for the drama of human life? If modern science has now become the dominant culture, how does Christianity look within it? What difference does the Christian idea of the contingency of nature make to science today? What difference does it make for Christian thought and culture to move away from the old idea of the world as a closed mechanical system of cause and effect into the new idea of the world as an open dynamic system configured by the behavior of light, the fastest messenger in the universe? These are some of the questions discussed in the light of James Clerk Maxwell's discoveries of the mathematical properties of light, and of Albert Einstein's generalization of the new understanding of light for a radically new and exciting view of nature that has made space travel possible and enabled us to trace the expansion of the universe back to conditions near its beginning. This is not a defensive book about science and religion in the usual vein. It is concerned rather with the deep mutual relation and respect of Christian and scientific thought for each other, and shows how this relationship throws new light upon basic Christian doctrines. This volume also warns against the dangers of a reactionary retreat from the rigors of scientific thought into fuzzy mythological interpretations of the incarnation, and calls for a deeper appreciation of the Nicene Creed upon which all Christendom rests.

Religion vs. Science

The conflict between science and religion seems indelible, even eternal. Surely two such divergent views of the universe have always been in fierce opposition? Actually, that's not the case, says Peter Harrison: our very concepts of science and religion are relatively recent, emerging only in the past three hundred years, and it is those very categories, rather than their underlying concepts, that constrain our understanding of how the formal study of nature relates to the religious life. In *The Territories of Science and Religion*, Harrison dismantles what we think we know about the two categories, then puts it all back together again in a provocative, productive new way. By tracing the history of these concepts for the first time in parallel, he illuminates alternative boundaries and little-known relations between them—thereby making it possible for us to learn from their true history, and see other possible ways that scientific study and the religious life might relate to, influence, and mutually enrich each other. A tour de force by a distinguished scholar working at the height of his powers, *The Territories of Science and Religion* promises to forever alter the way we think about these fundamental pillars of human life and experience.

The Relations Between Religion and Science

These essays address broad topics such as the popularization of scientific ideas, secularization and the development of the naturalistic worldview.

Science and Religion, 1450–1900

Science versus Christianity? Reason versus Faith? The relationship between science and Christianity is all too often framed within such modernist polarizations, even though we are now living in a postmodern world! But from a Christian perspective, if such conflict theses are to be discredited, what assumptions about the scientific endeavor, the nature of nature, reason, revelation, and knowledge should undergird the relation between science and Christianity? *Science & Grace* critically examines contemporary assumptions and then positively re-describes scientific endeavors in ways that encourage faithful and joyful Christian involvement in the science of our day, both as "consumers" of the fruits of scientific work and as producers of new scientific insights into God's works on display in His universe. In *Science & Grace*, the authors go beyond the more common focus on creation, evolution, and intelligent design to address more novel questions concerning science and Christianity. The first section reviews a variety of developments both inside and outside of science to indicate that the Enlightenment hope of a simple picture of science, providing its own foundation and sustaining power, doesn't work. The section goes on to locate a faithful Christian approach to science in the midst of the general cultural shift from

modernism to postmodernism as one that thoroughly embraces the need for each worldview to give its own account of how science "works." For the Christian, this indicates the need for a theology of science. The second section approaches the relation of God to His creation through a robust trinitarian theology that highlights the divine action of the transcendent purposes of the Father, mediated through the Son, and brought to fruition by the immanent presence of the Spirit. The triune God's covenantal faithfulness to His creation is then the reason for the regularities we perceive as scientific laws. In this context, the dualistic tendency to pit "natural processes" against "supernatural intervention" perceived as miracles is shown to be an unnecessary consequence of the history of the rise of mechanism. We can thus understand science from a Christian perspective as one avenue of many through which we are able to see and respond to God's faithfulness to His covenant promises. The third section examines how doing science from a Christian perspective naturally flows from the Great Commandment to love God and neighbor, or put it another way, to love God with all our being, knowing, and doing. In terms of being, this section re-orientes the meaning of our scientific work and its significance in history by exploring who humans are and what creation is in terms of their relation to God and how those relationships are impacted by the major episodes in redemptive history: Creation, Fall, Redemption, and Consummation. Then knowing is described in terms of faithfully responding to God's revelation in His Word and world, responses that include both submission to "order as given" and creative stewardship in handling "order as task." Pleasing God in our knowing should be the Christian's prime concern, rather than narrowly pursuing the satisfaction of humanly formulated knowing criteria. Finally concerning the doing aspect, being good stewards of our scientific gifts requires that we "do" as confident, attentive and submissive servants who are committed to the gracious authority of His Word, His Church, and His World. In the final section, in seeking out ways to "do" as good neighbors in the scientific culture of our times, Science & Grace describes how Christians are to be good stewards of God's favor and His judgment in scientific work. We are to rejoice in the fruits of our common labors with our non-Christian colleagues but also we are not to neglect our obligation, in love, to warn them of the wrath of God that will judge persisting unbelief.

Reason and Reality

The New York Times bestselling author explains why any attempt to make religion compatible with science is doomed to fail. What we read in the news today is full of subjectivity, half-truths, and blatant falsehoods; and thus it is more necessary now than ever to safeguard the truth with facts. In his provocative new book, evolutionary biologist Jerry A. Coyne aims to do exactly that in the arena of religion. In clear, dispassionate detail he explains why the toolkit of science, based on reason and empirical study, is reliable, while that of religion—including faith, dogma, and revelation—leads to incorrect, untestable, or conflicting conclusions. Coyne is responding to a national climate in which over half of Americans don't believe in evolution (and congressmen deny global warming), and warns that religious prejudices and strictures in politics, education, medicine, and social policy are on the rise. Extending the bestselling works of Richard Dawkins, Daniel Dennett, and Christopher Hitchens, he demolishes the claims of religion to provide verifiable "truth" by subjecting those claims to the same tests we use to establish truth in science. Coyne irrefutably demonstrates the grave harm—to individuals and to our planet—in mistaking faith for fact in making the most important decisions about the world we live in.

Science and Religion

In recent years a noticeable trend toward harmonizing the distinct worldviews of science and religion has become increasingly popular. Despite marked public interest, many leading scientists remain skeptical that there is much common ground between scientific knowledge and religious belief. Indeed, they are often antagonistic. Can an accommodation be reached after centuries of conflict? In this stimulating collection of articles on the subject, Paul Kurtz, with the assistance of Barry Karr and Ranjit Sandhu, have assembled the thoughts of scientists from various disciplines. Among the distinguished contributors are Sir Arthur C. Clarke (author of 2001: A Space Odyssey, and numerous other works of science fiction); Nobel Prize Laureate Steven Weinberg (professor of physics at the University of Texas at Austin); Neil deGrasse Tyson (Princeton University astrophysicist and director of the Hayden Planetarium); James Lovelock (creator of the Gaia hypothesis); Kendrick Frazier (editor of the Skeptical Inquirer); Steven Pinker (professor of psychology at MIT); Richard Dawkins (zoologist at Oxford University); Eugenie Scott (physical anthropologist and executive director of the National Center for Science Education); Owen Gingerich (professor of astronomy at Harvard University); Martin Gardner (prolific popular science writer); the late Richard Feynman (Nobel Prize-winning physicist) and

Stephen Jay Gould (professor of geology at Harvard University); and many other eminent scientists and scholars. Among the topics discussed are the Big Bang and the origin of the universe, intelligent design and creationism versus evolution, the nature of the "soul," near-death experiences, communication with the dead, why people do or do not believe in God, and the relationship between religion and ethics.

Christian Theology and Scientific Culture

Written by distinguished historians of science and religion, the thirty essays in this volume survey the relationship of Western religious traditions to science from the beginning of the Christian era to the late twentieth century. This wide-ranging collection also introduces a variety of approaches to understanding their intersection, suggesting a model not of inalterable conflict, but of complex interaction. Tracing the rise of science from its birth in the medieval West through the scientific revolution, the contributors describe major shifts that were marked by discoveries such as those of Copernicus, Galileo, and Isaac Newton and the Catholic and Protestant reactions to them. They assess changes in scientific understanding brought about by eighteenth- and nineteenth-century transformations in geology, cosmology, and biology, together with the responses of both mainstream religious groups and such newer movements as evangelicalism and fundamentalism. The book also treats the theological implications of contemporary science and evaluates recent approaches such as environmentalism, gender studies, social construction, and postmodernism, which are at the center of current debates in the historiography, understanding, and application of science. Science and Christianity in Pulpit and Pew

The first volume of the new series Science and the Orthodox Church focuses on the nature of the relationship between modern Science and Orthodox Christianity with its centuries-old tradition. Orthodoxy today shares a variety of--sometimes ambiguous--attitudes towards modern Science shaped by the texts of the Church Fathers, medieval and modern theologians and scholars, as well as contemporary social realities. On the other hand, modern Science, which sprung from the seventeenth-century quest by Western-European philosophers for rationality, is faced with crucial and uneasy questions about the meaning of life and the position of Humankind within the natural world. The main goal of the volume is to define the patterns of the Science-religion relationship in the Orthodox world, especially in the light of the most recent trends in both Science and Theology. Is this a relationship of dialog or conflict? Of integration or independence? What is the impact of the revival of patristic studies and

new theological currents on the relationship? But also what is the relevant impact of new scientific discoveries on the image of the Human and the Universe? Has the modern Science-religion dialog in the West influenced Eastern Christianity in its effort to create new perspectives and concepts in response to new challenges? These questions are crucial for understanding and mapping the current science-religion dialog in the Orthodox world, and apart from recording given views and opinions.

We then explore the human genome. This video ...

Chromosomes are found in the nucleus of cells.

A key fact is that chromosomes contain the molecule DNA.

Scientists say that DNA is the genetic material.

DNA consists of two strands.

Each strand is made by joining together lots of smaller molecules.

In DNA, the two strands wrap around each other to form a double helix.

It is really important that you learn the term double helix.

As we said, DNA is found in chromosomes.

This shows a picture of a chromosome.

A key fact is that a gene is a small section of DNA on a chromosome.

This gene is found on chromosome number 9.

Proteins are made by joining together amino acids.

Each gene encodes for a specific sequence of amino acids to make a specific protein.

The blood type gene encodes the sequence of amino acids for the protein that determines blood type.

Humans have literally thousands of genes.

Chromosome 9 has well over 700 different genes.

In this case, both copies of chromosome 9 have the gene for blood type.

We are going to finish now by looking at the genome.

The genome is the entire genetic material of an organism.

The human genome is the entire genetic material that makes a human.

Scientists have now studied the entire human genome

Understanding the human genome will help us to search for genes that are linked to a disease...

Understanding the human genome will help us to understand and treat inherited disorders eg cystic fibrosis.

We can use the human genome to trace human migration patterns from the past.

This helps people to discover their ancestry.
