The Archives of Internal Medicine, Vol. 18

Excerpt from The Archives of Internal Medicine, Vol. 10 Onset - The patient was, at the time of onset, and had been for five years previously. A mail-carrier in the rural free delivery service, having to ride thirty miles daily over rough roads. There was some exposure to cold. But not excessive. Four years ago, in the spring, he first noticed frequent urination, both diurnal and nocturnal. This rapidly increased in frequency, until it became embarrassing. 110 would have to stop every half hour or even more frequently while on his route. Auv attempt to suppress this tendency resulted in great misery. The quantities were large at each urination. There would be four or five nocturnal micturitions. The quantity was several quarts a day. His mouth and throat felt constantly parched, in spite of the great amounts of water drunk. The tongue was dry. Bulimia also developed in the spring. The Archives of Internal Medicine, Vol. 1

Excerpt from The Archives of Internal Medicine, Vol. 17: January 15, 1916 At thirteen the patient had had scarlet fever, and six months later diphtheria, followed by more or less extensive paralysis. In other respects she had been a healthy woman and had had several children. For ten or twelve years, however, there had been some shortness of breath on exertion, and for eight months, frequent bleeding from the nose. For two months she had had peculiar periods of dizziness in which it had been noticed that her pulse was slow and irregular. Two weeks before she had had a sudden attack characterized by loss of consciousness and repeated slight convulsive seizures. Immediately after the attack the pulse was very slow, about 18 to the minute, and fairly regular. On the morning preceding the attack it had been 44; since the attack it had ranged between 28 and 35. Examination showed a fairly healthy looking woman, lying on her back in bed. The pulse was regular, 36 to the minute. On inspection of the neck, by a rather poor light, there was a well-marked impulse in the jugular with each beat of the pulse, together with a second impulse, occurring at a point about midway between each beat. A satisfactory analysis of the jugular undulation was impossible because of the dim ness of the light. The heart was slightly enlarged; the sounds were clear throughout. There was heard, however, between each regular beat, a slight but yet distinctly audible sound. This occurred constantly about midway between the regular heart sounds, and had the general character of the sound which one commonly hears in association with

the auricular contraction in heart block. About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books. Excerpt from Internal Medicine, Vol. 1 of 3: A Work for the Practicing Physician on Diagnosis and Treatment, With a Complete Desk Index In the making Of a. Handbook of this kind it is necessary to draw at every step upon the great fund of acquired information which has become the common property of the profession. To those whose contributions have formed that fund and to those who are daily adding to it I tender grateful acknowledgment for its use. I have mentioned by name those to whose work I have especially referred, but, as a general rule, it has been impracticable for want of space to append systematic references to the literature. The illustrations are in large part drawn from personal observations. They have been selected solely with the View to elucidate the subject in hand. Diagrams have been employed when this method of presentation has appeared desirable, and the free

use of clinical charts constitutes an important feature of the work. About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books.
