Prehistoric Ancestors of Modern Animals

What if elephants were as small as dogs? What if frogs were protected by armor? In prehistoric times, they were! In fact, other than a few unique changes, lots of prehistoric beasts looked similar to modern animals that live on Earth. Hedgehogs had long tails and no quills, some birds laid eggs the size of footballs, and dragonflies could eat reptiles and amphibians! If these extinct beasts came to life, they might look familiar—but you wouldn't want to get in their way! Read this book to learn more about the incredible and terrifying prehistoric ancestors of modern animals.

Endangered and Extinct Prehistoric Animals

Provides short descriptions and illustrations of various creatures from prehistoric times, including fish, dinosaurs, mammals, and birds.

The Complete Guide to Prehistoric Life

From the creators of Walking with Dinosaurs comes this stunning visual encyclopedia of prehistoric animals. The Complete Guide to Prehistoric Life is a who's who of the prehistoric world from primitive amphibians and giant armoured fish, to predatory dinosaurs and sabre-toothed cats. Tracing the amazing story of the evolution of life on Earth, the book features over 100 of the largest, weirdest and scariest animals that ever existed. Here, for the first time, we meet some of the truly bizarre creatures that thrived hundreds of millions of years before the dinosaurs roamed the Earth: for example, Pterygotus, a three-metre long sea scorpion, and Hyneria, a two-tonne killer fish that was capable of walking on land. Many of these magnificent creatures have never been visualized before. Moving through the dinosaur era, the book recreates these awesome super-beasts and vividly depicts the landscapes in which they lived and died. All the favourites are here from Tyrannosaurus and Diplodocus to Iguanodon and Velociraptor. With the dying out of the dinosaurs we are introduced to a whole new cast of characters, no less fascinating the weird and wonderful mammals that are the ancestors of modern humans. What did these animals eat? How did they raise their young? How did they survive attack? The Complete Guide to Prehistoric Life is packed full of the latest scientific evidence on each

animals biology, lifestyle and behaviour, and highlights key facts on size, diet and distribution. Illustrated with impressive digital imagery and remarkable fossil finds, this comprehensive field guide brings alive the creatures of the past in a breathtakingly realistic way.

Extinct Animals

Everyone is familiar with the dodo and the woolly mammoth, but how many people have heard of the scimitar cat and the Falkland Island fox? *Extinct Animals* portrays over 60 remarkable animals that have been lost forever during the relatively recent geological past. Each entry provides a concise discussion of the history of the animal—how and where it lived, and how it became extinct—as well as the scientific discovery and analysis of the creature. In addition, this work examines what led to extinction—from the role of cyclical swings in the Earth's climate to the spread of humans and their activities. Many scientists believe that we are in the middle of a mass extinction right now, caused by the human undermining of the earth's complex systems that support life. Understanding what caused the extinction of animals in the past may help us understand and prevent the extinction of species in the future. *Extinct Animals* examines the biology and history of some of the most interesting creatures that have ever lived, including: The American Terror Bird, which probably became extinct over 1 million years ago, who were massive predators, some of which were almost 10 feet tall; the Rocky Mountain Locust, last seen in 1902, formed the most immense animal aggregations ever known, with swarms estimated to include over 10 trillion insects; the Giant Ground Sloth, which was as large as an elephant; and the Neandertals, the first Europeans, which co-existed with prehistoric *Homo sapiens*. *Extinct Animals* includes illustrations—many created for the work—that help the reader visualize the extinct creature, and each entry concludes with a list of resources for those who wish to do further research.

Beasts Before Us

For most of us, the story of mammal evolution starts after the asteroid impact that killed the dinosaurs, but over the last 20 years scientists have uncovered new fossils and used new technologies that have upended this story. In *Beasts Before Us*, palaeontologist Elsa Panciroli charts the emergence of the mammal lineage, Synapsida, beginning at their murky split from the reptiles in the Carboniferous period, over three-hundred million years ago. They made the world theirs long before the rise of dinosaurs. Travelling forward into the Permian and then Triassic periods, we learn how our ancient mammal ancestors evolved from large hairy beasts with accelerating metabolisms to exploit miniaturisation, which was key to unlocking the traits that define mammals as we now know them. Elsa criss-crosses the globe to explore the sites where discoveries are being made and meet the people who make them. In Scotland, she traverses the desert dunes of prehistoric Moray, where quarry workers unearthed the footprints of Permian creatures from before the time of dinosaurs. In South Africa, she introduces us to animals, once called 'mammal-like reptiles', that gave scientists the first hints that our furry kin evolved from a lineage of egg-laying burrowers. In China, new, complete fossilised skeletons reveal mammals that were gliders, shovel-pawed Jurassic moles, and flat-tailed swimmers. This book radically reframes the narrative of our mammalian ancestors and provides a counterpoint to the stereotypes of mighty dinosaur overlords and cowering little mammals. It turns out the earliest mammals weren't just precursors, they were pioneers.

Prehistoric Sea Beasts

The ocean is filled with giant, strange, and scary creatures such as whales, octopuses, and sharks—but the prehistoric megalodon was powerful enough to crush a killer whale. Other sea beasts of the past could hold their own against even the most mysterious of modern sea creatures. Sea scorpions had claws the size of tennis rackets. *Tanystropheus* used its long neck to catch fish from land. And *Leedsichthys* had as many as 40,000 teeth! What would happen if these extinct beasts came to life? Imagine prehistoric sea beasts chasing dolphins, fighting crocodiles, and hunting humpback whales—and learn all about the prehistoric creatures of the deep!

Handbook of Dinosaurs

A recognition guide to over 200 dinosaurs and other prehistoric animals. It features clear photographs of fossils sitting alongside realistic artworks and digital images that show how the animals may have appeared in the flesh. In this fully revised and updated edition, jargon-free text pinpoints the key characteristics of each species and provides quick, accessible information.

The Rise and Fall of the Dinosaurs

Originally published in 2018 by arrangement with William Morrow, an imprint of HarperCollins Publishers.

Prehistoric Predators

Did you know that dinosaurs weren't the only prehistoric beasts on Earth? Even before the time when dinosaurs lived, there were many other incredible creatures, and some were even bigger and more terrifying than T. rex. Entelodonts had strong jaws designed to crush bones. Quetzalcoatlus was the largest ever flying creature—about the size of a fighter jet! And Dimetrodons were the first animals to have notched teeth for slicing through flesh. What would happen if these beasts came back to life? Imagine these prehistoric predators facing off against tigers, bears, and wolves—and learn all about the terrifying creatures of the past!

Dinosaurs and Other Prehistoric Animals

Describes the characteristics of various extinct animals as reconstructed from their fossilized remains.

After the Dinosaurs

A fascinating study of the thousands of new animal species that walked in the footsteps of the dinosaurs—and the climate changes that brought them forth. The fascinating group of animals called dinosaurs became extinct some 65 million years ago (except for their feathered descendants). In their place evolved an enormous variety of land creatures, especially mammals, which in their way were every bit as remarkable as their Mesozoic cousins. The Age of Mammals, the Cenozoic Era, has never had its Jurassic Park, but it was an amazing time in earth's history, populated by a wonderful assortment of bizarre animals. The rapid evolution of thousands of species of mammals brought forth many incredible creatures including our own ancestors. Their story is part of a larger story of new life emerging from the greenhouse conditions of the Mesozoic, warming up dramatically about 55 million years ago, and then cooling rapidly so that 33 million years ago the glacial ice returned. The earth's vegetation went through equally dramatic changes, from tropical jungles in Montana and forests at the poles. Life in the sea underwent striking evolution reflecting global climate change, including the emergence of such creatures as giant sharks, seals, sea lions, dolphins, and whales. Engaging and insightful, *After the Dinosaurs* is a book for everyone who has an abiding fascination with the remarkable life of the past.

Animals of the Past

DigiCat Publishing presents to you this special edition of "Animals of the Past" by Frederic A. Lucas. DigiCat Publishing considers every written word to be a legacy of humankind. Every DigiCat book has been carefully reproduced for republishing in a new modern format. The books are available in print, as well as ebooks. DigiCat hopes you will treat this work with the acknowledgment and passion it deserves as a classic of world literature.

Extinct Animals

Excerpt from *Animals of the Past: An Account of Some of the Creatures of the Ancient World* The original drawings, made especially for this book, are by Charles R. Knight and James M. Gleeson, under the direction of Mr. Knight. The fact that the originals of these drawings have been presented to and accepted by the United States National Museum is evidence of their scientific value. Mr. Knight has been commissioned by the Smithsonian Institution, the United States National Museum, and the New York Museum of Natural History, to do their most important pictures of extinct animals. He is the one modern artist who can picture prehistoric animals with artistic charm of presentation as well as with full scientific accuracy. In this instance, the author has personally superintended the artist's work, so that it is as correct in every respect as present knowledge makes possible. Of the minor illustrations, some are by Mr. Bruce Horsfall, an artist attached to the staff of the New York Museum of Natural History, and all have been drawn with the help of and under the author's supervision. About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books. Find more at www.forgottenbooks.com This book is a reproduction of an important historical work. Forgotten Books uses state-of-the-art technology to digitally reconstruct the work, preserving the original format whilst repairing imperfections present in the aged copy. In rare cases, an imperfection in the original, such as

a blemish or missing page, may be replicated in our edition. We do, however, repair the vast majority of imperfections successfully; any imperfections that remain are intentionally left to preserve the state of such historical works.

Extinct Monsters

Extinct Monsters : A Popular Account of Some of the Larger Forms of Ancient Animal Life Natural history is deservedly a popular subject. The manifestations of life in all its varied forms is a theme that has never failed to attract all who are not destitute of intelligence. From the days of the primitive cave-dwellers of Europe, who lived with mammoths and other animals now lost to the world; of the ancient Egyptians, who drew and painted on the walls of their magnificent tombs the creatures inhabiting the delta of the Nile; of the Greeks, looking out on the world with their bright and child-like curiosity, down to our own times, this old, yet ever new, theme has never failed. Never before was there such a profusion of books describing the various forms of life inhabiting the different countries of the globe, or the rivers, lakes, and seas that diversify its scenery. Popular writers have done good service in making the way plain for those who wish to acquaint themselves with the structures, habits, and histories of living animals; while for students a still greater supply of excellent manuals and text-books has been, and still continues to be, forthcoming. But in our admiration for the present we forget the great past. How seldom do we think of that innumerable [x]host of creatures that once trod this earth! How little in comparison has been done for them! Our natural-history books deal only with those that are alive now. Few popular writers have attempted to depict, as on a canvas, the great earth-drama that has, from age to age, been enacted on the terrestrial stage, of which we behold the latest, but probably not the closing scenes. Another object which the writer has kept in view is to connect the past with the present. It cannot be too strongly urged that the best commentary on the dead past is the living present. It is unfortunate that there is still too great a tendency to separate, as by a great gulf, the dead from the living, the past from the present, forms of life. The result of this is seen in our museums. Fossils have too often been left to the attention of geologists not always well acquainted with the structures of living animals. The more frequent introduction of fossil specimens side by side with modern forms of life would not only be a gain to the progress and spread of geological science, but would be a great help to students of anatomy and natural history. The tree of life is but a mutilated thing, and half its interest is gone, when the dead branches are lopped off. It is, perhaps, justifiable to give to the term "monster" a somewhat extended meaning. The writer has therefore included in his menagerie of extinct animals one or two creatures which, though not of any great size, are nevertheless remarkable in various ways—such, for instance, as the winged reptiles, and anomalous birds with teeth, of later times, and others. Compared with living forms, these creatures appear to us as "monstrosities," and may well find a place in our collection.

Animals of the Past

Meet the incredible animals that have disappeared due to competition, mass extinctions, hunting, and human activity. **Lost Animals** brings back to life some of the most charismatic creatures to inhabit the planet. It captures the imagination with more than 200 incredible photographs, artworks of fossils, and scientific drawings of charming creatures like dodos, paraceratherium (the largest land mammal), spinosaurus (the biggest carnivorous dinosaur), placoderm fishes (the sharks of their day), and more! **Lost Animals** is a captivating documentation of evolution and extinction. Each chapter focuses on a specific time in Earth's history, from the Cambrian explosion (the most intense surge of evolution the world has ever experienced) to present times, with profiles of the key species that lived then. From long extinct animals to Lazarus species--animals that were thought to be extinct before being rediscovered--this book takes readers on a journey through Earth's natural history, highlighting the world's biggest animal losses and its moments of conservational hope.

Extinct Monsters : A Popular Account of Some of the Larger Forms of Ancient Animal Life

Most children have heard about dinosaurs. But what other animals lived in prehistoric times? This series explores some of the unusual ancestors of modern mammals. Find out which animal was discovered in a Chinese drugstore and how downtown Los Angeles played a key role in filling out the fossil record. Each book also provides information about what they looked like and how they became extinct. Correlated to State Standards.

Prehistoric Life

In *The Last Days of the Dinosaurs*, Riley Black walks readers through what happened in the days, the years, the centuries, and the million years after the impact, tracking the sweeping disruptions that overtook this one spot, and imagining what might have been happening elsewhere on the globe. Life's losses were sharp and deeply-felt, but the hope carried by the beings that survived sets the stage for the world as we know it now. Picture yourself in the Cretaceous period. It's a sunny afternoon in the Hell Creek of ancient Montana 66 million years ago. A *Triceratops horridus* ambles along the edge of the forest. In a matter of hours, everything here will be wiped away. Lush verdure will be replaced with fire. *Tyrannosaurus rex* will be toppled from their throne, along with every other species of non-avian dinosaur no matter their size, diet, or disposition. They just don't know it yet. The cause of this disaster was identified decades ago. An asteroid some seven miles across slammed into the Earth, leaving a geologic wound over 50 miles in diameter. In the terrible mass extinction that followed, more than half of known species vanished seemingly overnight. But this worst single day in the history of life on Earth was as critical for us as it was for the dinosaurs, as it allowed for evolutionary opportunities that were closed for the previous 100 million years.

Lost Animals

Meet the incredible animals that have disappeared due to competition, mass extinctions, hunting, and human activity. *Lost Animals* brings back to life some of the most charismatic creatures to inhabit the planet. It captures the imagination with more than 200 incredible photographs, artworks of fossils, and scientific drawings of charming creatures like dodos, *paraceratherium* (the largest land mammal), *spinosaurus* (the biggest carnivorous dinosaur), *placeoderm* fishes (the sharks of their day), and more! *Lost Animals* is a captivating documentation of evolution and extinction. Extinct Monsters and Creatures of Other Days

A must-have for all dinosaur enthusiasts. Discover 400 million years of life from jawless fish to *Allosaurus* and giant sloths to the dawn of mankind. Organised into four easy-to-use sections plus a comprehensive reference section explaining how to find, study and date fossils.

Animals Before Man in North America

A top genealogist "shows how genetics helps and how it roots each of us in this magnificent story of Life on Earth in the most meaningful way imaginable."—*Reunite Magazine* "What a fine long pedigree you have given the human race."—Charles Darwin to Charles Lyell, 1863 How distantly are we related to dinosaurs? How much of your DNA came from Neanderthals? How are the builders of Stonehenge connected to great-grandpa? According to science, life first appeared on Earth about 3,500 million years ago. Every living thing is descended from that first spark, including all of us. But if we trace a direct line down from those original life forms to ourselves, what do we find? What is the full story of our family tree over the past 3,500 million years, and how are we able to trace ourselves so far back? From single-celled organisms to sea-dwelling vertebrates; amphibians to reptiles; tiny mammals to primitive man; the first *Homo sapiens* to the cave painters of Ice Age Europe and the first farmers down to the Norman Conquest, this book charts not only the extraordinary story of our ancient ancestors but also our 40,000-year-long quest to discover our roots, from ancient origin myths of world-shaping mammoths and great floods down to the scientific discovery of our descent from the Genetic Adam and the Mitochondrial Eve. "Having read it I'm still slightly shell-shocked by the range of topics that he covers, from the origins of the universe and life on Earth to the present-day DNA analysis that aims to answer some of our questions about our past. And everything in between!"—*LostCousins*

Prehistoric Animals Set 2

Gorillas can be pretty big, but just wait until you see *Gigantopithecus*. This huge ape lived 9 million years ago and was three times as heavy and two times as tall as a modern gorilla. There were lots of other prehistoric giants, too. Giant camels lived in the United States and even in the Arctic. Another beast was *Stupendemys*—a turtle so large that a car could fit on its shell! What would happen if these

giant beasts came to life? Imagine prehistoric giants walking the streets of New York and climbing the Great Wall of China—and learn amazing facts about these fascinating creatures!

The Last Days of the Dinosaurs

The ultimate illustrated guide to the lost world of prehistoric mammals After the mass extinction of the dinosaurs 65 million years ago, mammals became the dominant terrestrial life form on our planet. Roaming the earth were spectacular beasts such as saber-toothed cats, giant mastodons, immense ground sloths, and gigantic giraffe-like rhinoceroses. Here is the ultimate illustrated field guide to the lost world of these weird and wonderful prehistoric creatures. A woolly mammoth probably won't come thundering through your vegetable garden any time soon. But if one did, this would be the book to keep on your windowsill next to the binoculars. It covers all the main groups of fossil mammals, discussing taxonomy and evolutionary history, and providing concise accounts of the better-known genera and species as well as an up-to-date family tree for each group. No other book presents such a wealth of new information about these animals—what they looked like, how they behaved, and how they were interrelated. In addition, this unique guide is stunningly illustrated throughout with full-color reconstructions of these beasts—many never before depicted—along with photographs of amazing fossils from around the world. Provides an up-to-date guidebook to hundreds of extinct species, from saber-toothed cats to giant mammoths Features a wealth of color illustrations, including new reconstructions of many animals never before depicted Demonstrates evolution in action—such as how whales evolved from hoofed mammals and how giraffes evolved from creatures with short necks Explains how mass extinctions and climate change affected mammals, including why some mammals grew so huge

Lost Animals

“An enjoyable read that provides a substantial amount of detail on the biology, ecology, and distribution of these fantastic animals . . . Highly recommended.” —Choice More than 10,000 years ago spectacularly large mammals roamed the pampas and jungles of South America. This book tells the story of these great beasts during and just after the Pleistocene, the geological epoch marked by the great ice ages. Megafauna describes the history and way of life of these animals, their comings and goings, and what befell them at the beginning of the modern era and the arrival of humans. It places these giants within the context of the other mammals then alive, describing their paleobiology—how they walked; how much they weighed; their diets, behavior, biomechanics; and the interactions among them and with their environment. It also tells the stories of the scientists who contributed to our discovery and knowledge of these transcendent creatures and the environment they inhabited. The episode known as the Great American Biotic Interchange, perhaps the most important of all natural history “experiments,” is also an important theme of the book, tracing the biotic events of both North and South America that led to the fauna and the ecosystems discussed in this book. “Collectively, this book brings attention to the discovery and natural history of ancient beasts in South America while providing a broader temporal and geographic background that allows readers to understand their evolution and potential immigration to South America.” —Quarterly Review of Biology “An excellent volume . . . This book is likely to facilitate progress in the understanding of fossil mammals from the Americas.” —Priscum

Encyclopedia of Dinosaurs and Prehistoric Life

TV scientist Ben Garrod presents the biggest extinction events ever, told from the point of view of evolution's superstars, the most incredible animals ever to swim, stalk, slither or walk our planet. Whether you're 9 or 90, his unique exploration of the most destructive, yet most creative, force in nature makes top level science fun. Here are the superstars of the story of life, from the super-weird to the super-ferocious. Usually a species has 10 million years or so of evolving, eating, chasing, playing, maybe doing homework, or even going to the moon before it goes extinct. Dunkleosteus was super-snappy. With a bite 10 times stronger than a great white shark, it could snap its jaws 5 times faster than you can blink! Discover its habitat, what it ate and what it was like to live in the shadow of this one-tonne predator until it went extinct at the end of the Age of Fishes. 'This book is amazing and the illustrations are spectacular! I want to read the rest of the books in this series!' Toppsta Collect all eight books about animals we have lost in mass extinctions caused by asteroids or mega-volcanoes, clashing continents and climate change. Past brought to full-colour life by palaeoartist Gabriel Ugueto

In Search of Our Ancient Ancestors

Ah, the Eocene Period, when life in the Paleogene Hot House reached peak excitement! When the ancestors of modern animals battled, ate, and were eaten by their archaic relatives. Who were these ancient monsters? Look and see!

Man's Unknown Ancestors

The fascinating story of how the fossils of dinosaurs, mammoths, and other extinct animals influenced some of the most spectacular creatures of classical mythology Griffins, Centaurs, Cyclopes, and Giants—these fabulous creatures of classical mythology continue to live in the modern imagination through the vivid accounts that have come down to us from the ancient Greeks and Romans. But what if these beings were more than merely fictions? What if monstrous creatures once roamed the earth in the very places where their legends first arose? This is the arresting and original thesis that Adrienne Mayor explores in *The First Fossil Hunters*. Through careful research and meticulous documentation, she convincingly shows that many of the giants and monsters of myth did have a basis in fact—in the enormous bones of long-extinct species that were once abundant in the lands of the Greeks and Romans. As Mayor shows, the Greeks and Romans were well aware that a different breed of creatures once inhabited their lands. They frequently encountered the fossilized bones of these primeval beings, and they developed sophisticated concepts to explain the fossil evidence, concepts that were expressed in mythological stories. The legend of the gold-guarding griffin, for example, sprang from tales first told by Scythian gold-miners, who, passing through the Gobi Desert at the foot of the Altai Mountains, encountered the skeletons of Protoceratops and other dinosaurs that littered the ground. Like their modern counterparts, the ancient fossil hunters collected and measured impressive petrified remains and displayed them in temples and museums; they attempted to reconstruct the appearance of these prehistoric creatures and to explain their extinction. Long thought to be fantasy, the remarkably detailed and perceptive Greek and Roman accounts of giant bone finds were actually based on solid paleontological facts. By reading these neglected narratives for the first time in the light of modern scientific discoveries, Adrienne Mayor illuminates a lost world of ancient paleontology.

Prehistoric Giants

What caused the extinction of so many animals at or near the end of the Pleistocene? Was it overkill by human hunters, the result of a major climatic change or was it just a part of some massive evolutionary turnover? Questions such as these have plagued scientists for over one hundred years and are still being heatedly debated today. *Quaternary Extinctions* presents the latest and most comprehensive examination of these questions. ÑGeological Magazine "May be regarded as a kind of standard encyclopedia for Pleistocene vertebrate paleontology for years to come." ÑAmerican Scientist "Should be read by paleobiologists, biologists, wildlife managers, ecologists, archeologists, and anyone concerned about the ongoing extinction of plants and animals." ÑScience "Uncommonly readable and varied for watchers of paleontology and the rise of humankind." ÑScientific American "Represents a quantum leap in our knowledge of Pleistocene and Holocene palaeobiology. . . . Many volumes on our bookshelves are destined to gather dust rather than attention. But not this one." ÑNature "Two strong impressions prevail when first looking into this epic compendium. One is the judicious balance of views that range over the whole continuum between monocausal, cultural, or environmental explanations. The second is that both the data base and theoretical sophistication of the protagonists in the debate have improved by a quantum leap since 1967." ÑAmerican Anthropologist

Palaeontology Or a Systematic Summary of Extinct Animals and Their Geological Relations

Here is a natural history of times past, featuring real creatures that lived, breathed, reproduced, then died forever. A visual who's who of prehistoric life.

The Princeton Field Guide to Prehistoric Mammals

Our knowledge of extinct animals depends almost entirely upon the study of fossils. This richly illustrated book clothes the skeletons of dinosaurs and other Mesozoic reptiles with flesh, and shows how these fascinating animals evolved and probably lived. Expert author John L. Cloudsley-Thompson provides an interesting synthesis of current views on their ecology, physiology and behaviour, and outlines the various hypotheses that have been proposed to explain their extinction. Numerous beautiful drawings of the animals and their environment illustrate this exciting monograph.
