Photosynthesis Chapter 8

Chloroplasts: The Sites of Photosynthesis in Plants • Leaves are the major locations of photosynthesis . Their green color is from chlorophyll, the green pigment within chloroplasts • Chloroplasts are found mainly in cells of the mesophyll, the interior tissue of the leaf mesophyll cell contains 30-40 chloroplasts

Photosynthesis as a Re • Photosynthesis reverses the direct flow compared to respiration • Photosynthesis is a redox process oxidized and Co, is reduced • Photosynthesis is an endergonic boost is provided by light

Photosynthesis consists of the light reactions (the photo part) and Calvin cycle (the synthesis part)

The light reactions in the thylakoids

Excited electrons fall down an electron transport chain from the primary electron acceptor of PS I to the protein ferredoxin (Fd) 8. The electrons are transferred to NADP, reducing it to NADPH, and become available for the reactions of the Calvin cycle

In mitochondria, protons are pumped to the intermembrane space and drive ATP synthesis as they diffuse back into the mitochondrial matrix

carbon fixation, involves the incorporation of the Co, molecules into ribulose biphosphate (RuBP) using the enzyme rubisco

regeneration, involves the rearrangement of G3P to regenerate the initial Co, receptor, RuBP
