Word Problems. Does even thinking about solving word problems in math make you feel tense, anxious, confused, or frustrated? You're not alone. Most high school students - even ones who excel in their math classes - find word problems on the PSAT/NMSQT, SAT, and ACT tough to solve consistently and efficiently. Adult students preparing for the GMAT or GRE find word problems just as daunting as

these were in high school. Most major publishers only briefly explain word problems and demonstrate simple examples in their study guides, but challenge students with very difficult practice problems. Even students in their test prep courses remain confused and lacking in confidence about how to approach word problems. All Your Word Problems Solved serves as an invaluable supplement to whichever test-specific study guide you prefer. This book will help you learn to systematically decode math word problems, set up the correct equations, organize your scratch work to "error-proof" yourself, and efficiently arrive at the right answer, every time. The strategies, approaches, techniques, and tips found in this book have been created and tested with students aged 15 to 40+ preparing for the most common standardized college and graduate admissions tests, including the GMAT, GRE, SAT, PSAT/NMSQT and ACT. In this book, you will learn a set of structured-but-flexible approaches which can be combined in different ways to solve even the hardest questions on your standardized tests. What makes this book so valuable? In the words of a GMAT student: "Clear explanation of how to organize your work and make sense of what you are actually solving for." Presentation of information is designed to accelerate your learning and improve your retention of facts, relationships, and formulas. Sample problems which demonstrate key methods progress in difficulty, so there is no huge jump between the examples and problems in the Official Guide. Refresher content and variety of examples for word problems related to concepts in Algebra 1, Algebra 2 and Geometry. You'll find out how to recognize, approach, and solve word problems of many types: linear equations, exponential growth, ratios, proportions, age problems, work-rate, distance-rate, systems of equations, mixtures, dilutions, interest, profit, percent change, complex geometric figures, probability, permutations & combinations, weighted averages, sequences, patterns, functions and symbol problems.

Algebra I: 1001 Practice Problems For Dummies (+ Free Online Practice)

This book is a collection of common verbal problems in Algebra with their corresponding solutions. The topics covered herein include miscellaneous practical problems that we encounter in our daily lives such as computations of: age, investment, mixture, motion, clock, work related problems leading to linear equations, quadratic equations, simultaneous quadratic equations, variations, arithmetic and geometric progressions, permutations and probability. This is a useful guide for both high school and college students, as well as for those engineering graduate students who are preparing for their board examinations.

Algebra for College Students

The unifying theme of this text is the development of the skills necessary for solving equations and inequalities, followed by the application of those skills to solving applied problems. Every section ending in the text begins with six simple writing exercises. These exercises are designed to get students to review the definitions and rules of the section before doing more traditional exercises.

Elementary Algebra for Schools

College Algebra actually makes sense and is something that you can figure out and understand why it works. This text focuses on a conceptual understanding of the big ideas in algebraic thinking, engaging the student in authentic problem solving and exploring the logical reasoning that underlies the various techniques and procedures in college algebra. An Inquiry-based Approach. Each section starts with a Class Activity to engage students in actually doing mathematics. Doing math is not just calculating or following a procedure. Doing math is figuring things out: investigating, making and testing conjectures, making arguments, and communicating your reasoning to others. The class activities are designed to highlight big algebraic ideas and spark a discussion of algebraic habits of mind, as well as students' alternate conceptions that lead to common algebra mistakes. Students are asked to analyze solutions, explore representations, explain why valid methods for simplifying expressions or solving equations work, and explain why invalid methods do not work. This book is intended to be read. Often math textbooks do not end up being read, but instead are used merely as a reference for their step-by-step procedures. Each section of this text has a "Read and Study" section that discusses the mathematics raised by the Class Activity and focuses on the mathematical reasoning and proof needed to nurture longer-lasting understanding of the content. This is meant to be read slowly and carefully, with pencil in hand. We pose questions that you should think about and answer before reading on. When we do work out an example, we do so to discuss the big ideas and illustrate our reasoning, not with the intention of providing you with a model to copy. Exercises vs. Problems. In the homework, we distinguish between "exercises" and "problems." Exercises are more routine, intended to give you more practice thinking

about the big concepts. In contrast, the "problems" are intended to be problematic, to take time to explore, develop and make connections, and often to extend your reasoning to develop new ideas. We do not include "answers" to these homework exercises and problems. Why struggle and persevere to figure something out and understand it when you can just look it up? Mathematics is not about getting the right answer; it's about figuring things out. It's about logical reasoning and being able to justify that what you claim is true. This doesn't mean that you are on your own. We will do our best in the Read and Study sections to discuss the big ideas, offer explanations, and show you some good examples of problem solving and making mathematical arguments. This text addresses the topics of a standard course in College Algebra, with the following sections: 1. Features of Algebraic Thinking 2. Algebraic Symbols 3. Sequences of Operations 4. Properties of Operations 5. The Distributive Law 6. Additive and Multiplicative Inverses 7. Using Inverses 8. Exponents 9. Roots of Numbers 10. Irrational and Imaginary Numbers 11.
