One Year to a Successful Massage Therapy Practice

The Second Edition of One Year to a Successful Massage Therapy Practice is designed for all massage practitioners, whether they are beginning their business or need to revitalize it. This new edition includes advice from many internationally-known massage therapists and educators about how they started their own careers. The text utilizes no-cost and low-cost marketing methods in a week-to-week planning format. Readers are encouraged to be proactive in their business and perform the activities set forth in each chapter, then journal their results. The marketing tips in this book are also useful for any holistic practitioner. When I started my own practice in a small town with a population of 4,000 people in 2003, these are the exact methods I used to build my own business, where I eventually employed a dozen practitioners. My goal was to get 365 new clients every year, and these methods allowed me to pull that off 9 out of the 13 years I owned the business. The original first edition of the book was published in 2008 (by Lippincott Williams & Wilkins) to detail the methods I used to do that. The introduction to this book, The Road to Success, explains some of the traditional concepts of marketing. Part I, Mapping Out Your Journey, is the real beginning of your work--mapping out your road to success by defining your goals, developing a marketing budget and calendar that can co-exist in prosperous harmony, and avoiding common pitfalls. Part II, Preparing for Your Trip, is about getting yourself ready for prosperity by being sure all the basics are covered--things like choosing just the right name for your business, making a great presentation, getting informative and appealing business literature, and using your telephone as a sales tool in the best possible way. Part III, The Path to Promotion, addresses promoting your business by utilizing everything from methods that won't cost you a cent to advertising that will cost you

as much money as you may want or have to spend, and how to make the best use of your hard-earned dollars by choosing your advertising venues wisely. Part IV, Trip Tips, is a resource guide in the form of appendices (national professional associations, sources for marketing materials, Internet resources, and a marketing calendar) to help you along on your trek to success. My Personal Journey, which is the most important feature in the book, will encourage readers to try the techniques found in the chapter. The premise of this book is that the therapist has to be proactive in order to be successful; the journaling will keep them on task, both in taking action and in tracking their progress. Each journal page includes the following parts: "This Week's Activity": a concrete activity for the reader to perform, based on the chapter content--taking positive action in order to create prosperity. "My Goals": provides space for readers to identify their goals based on the chapter content and the activity. "What's in my way?": encourages readers to explore the obstacles facing them so that they can determine if the particular activity will or will not work for them. The true exploration is in whether or not there are real obstacles, or whether the perceived obstacles are just mental blocks of their own making. "What action can I take to remedy the situation?": encourages readers to move past the obstacles, real or perceived, by deciding on a positive course of action and then taking it. "One Year Progress Update": provides space for readers to return to each activity in a year to let them see how each activity did or did not work for them. It allows them to refine their marketing plan for the future. The Second Edition will put you well on your way to cultivating the practice your heart desires.

A widely used, quick procedure for producing and purifying a protein involves the addition of a peptide tag to the protein of interest. In this procedure, a segment of DNA encoding the protein of interest

will be inserted into a plasmid with a number of key features

The plasmid contains a replication origin, which allows the plasmid to replicate in host E. coli cells. It also contains a gene that confers resistance to the antibiotic ampicillin, allowing selection for cells that carry the plasmid. A multiple cloning site provides a number of sites

When the enzyme PstI digests the plasmid, for example, it produces blunt ends on the DNA. The DNA with the protein coding region is also blunt-ended; it can be ligated

upstream of the inserted DNA are three bases that remain from the multiple cloning site. CAG codes for the amino acid glutamine. Next, six histidine codons encode the peptide tag. Upstream are two more codons, one of which is a

Another important region in the engineered plasmid is a ribosome-binding site. The ribosome binds to the RNA at this site before locating the first AUG start codon and translating the RNA into protein. The ribosome continues translation until reaching a stop codon.

When cells transformed with this plasmid are induced to express the tagged protein, the tagged protein becomes abundant in the cell, constituting up to 30% of the cellular protein. With many such cells growing in culture, a large amount of the tagged protein can be produced.

The next step is to harvest the cells, break them open and prepare a crude cell extract. A column, consisting of agarose beads attached to nickel atoms, can separate the tagged proteins from the rest of the cellular material. Within the column, the histidine tags on the proteins have affinity for and bind to the nickel-bearing agarose beads.

The **proteins**, that lack the tags, do not stick to nickel and ...

The tagged protein is eluted from the column. A low pH solution causes the histidine residues to become protonated and unable to bind to the nickel on the beads. Alternatively, a solution with a molecule called imidazole competes with histidine for nickel binding. In each case, the tagged proteins are released from the column.

After the tagged protein elutes from the column, an enzyme is added to remove the tag from the amino terminal end of the protein. Another enzyme is added at the same time to modify the glutamine residue at the end of the tag. This modification prevents the digestion of the protein of interest.

The enzymes used in this system have been engineered with histidine tags of their own. The tags allow the enzymes to be retained on a nickel-based column, while the protein of interest washes through.

Amine Reactive Chemistry - Why Amines? • Easily Accessible Targets on Proteins. . A wide selection of chemistries, kits and dyes • Easy workflow that produces stable conjugates • How they work: - Target amine must be deprotonated to react. Increasing the pH of the reaction solution will make them reactive to nucleophilic substitution

Application: Protein - Protein Conjugation Utilizing a crosslinker to attach a thiol from one biomolecule to the amine of another to form a stable thioether. In this diagram the amine is reacted with SMCC to form a maleimide. This binds a DTT reduced thiol.

Targeting other Groups - EDAC • Carbodimides, like EDAC, are cross linkers that attach amines to carboxylate groups. . It is the main method for conjugating quantum dots and microspheres. • Carbodiimide modification of a carboxylic acid group in a protein, followed by rearrangement to yield a stable N-acylurea.

The most common method for introducing aldehydes and ketones into glycoproteins (including antibodies) is by periodate- mediated oxidation of vicinal diols.

Getting Started - Choosing a Kit • The basic questions to ask: - What is your molecule? Antibody or Other? - Is the protein purified? - What is it in? PBS? Tris? Imidazole? Does it have APEX® Antibody Labeling Kits • APEX® Kits covalently label small amounts of antibody, 10-20 mg • Stabilizing proteins or amine-containing buffers will not interfere with labeling • Uses standard pipette (for 200 ul volume)

Kits are composed of reactive dye, buffer system and spin column with resin. • Designed to label 100 ug amounts of IgG. • Proteins must free of competing amines. • Available with Alexa Fluor dyes.

Kits are composed of reactive dye, buffer system, spin filter, and resin. • Designed to label 20-100 ug amounts of protein 12,000 Dalton. • Proteins must free of competing amines. • Available with Alexa Fluor dyes and biotin.

Optimized for Direct IgG Labeling - Simple and easy to use protocols - Reactive dye, buffers, and purification components

Start with your antibody at the highest concentration possible to allow efficient conjugation. • Make sure your protein can handle being reduced, and alter reducing conditions if needed. • Reduced antibody should be mixed with the SMCC-modified dots immediately after it comes off the column.

Do It Yourself Options • Dyes and haptens in different sizes • Crosslinking and reducing agents-SMCC, SPDP, DTT, TCEP • R-phycoerythrin, pyridyldisulfide derivative (P806) for easy conjugation. • Biotinylation and various avidin conjugates. • Click Reagents - Azide, alkyne and DIBO reactive

Unless you are sure of the buffer composition of your protein, always dialyze it against PBS and recheck protein concentration before labeling. . To start the column dripping after loading the resin, apply pressure to the top of the column with a bulb or your fingertip. • To remove excess free dye from your conjugate, let sit for 48 hours at 4° C then re-purify with a column or dialysis.

If labeling affects binding affinity using traditional methods, consider Zenon labeling or APEX® labeling to avoid labeling in the binding site. • Invest in a handy guide, we recommend "Bioconjugate Techniques", by Greg T. Hermanson.
